uranium from any ore processed primarily for its source material content.[3]" 40 CFR 61.251(g). For clarity, in this proposed rule we refer to this source category by the term "uranium recovery facilities" and we are proposing to add this phrase to the definitions section of the rule. Use of this term encompasses the existing universe of facilities whose HAP emissions are currently regulated under Subpart W. Uranium recovery facilities process uranium ore to extract uranium. The HAP emissions from any type of uranium recovery facility that manages uranium byproduct material or tailings is subject to regulation under Subpart W. This currently includes three types of uranium recovery facilities: (1) conventional uranium mills; (2) in-situ leach recovery facilities; and (3) heap leach facilities. Subpart W requirements specifically apply to the affected sources at the uranium recovery facilities that are used to manage or contain the uranium byproduct material or

---

[3] Pursuant to the Atomic Energy Act of 1954, as amended, the Nuclear Regulatory Commission defines "source material" as "(1) Uranium or thorium or any combination of uranium or thorium in any chemical or physical form; or (2) Ores that contain, by weight, one-twentieth of one percent (0.05 percent), or more, of uranium or thorium, or any combination of uranium or thorium." (10 CFR 20.1003) For a uranium recovery facility licensed by the Nuclear Regulatory Commission under 10 CFR Part 40, "byproduct material" means the "tailings or wastes produced by the extraction or concentration of uranium or thorium from ore processed primarily for its source material content, including discrete surface wastes resulting from uranium solution extraction processes." (10 CFR 20.1003 and 40.4)

tailings. Common names for these structures may include, but are not limited to, impoundments, tailings impoundments, evaporation or holding ponds, and heap leach piles. However, the name itself is not important for determining whether Subpart W requirements apply to that structure; rather, applicability is based on the use of these structures to manage or contain uranium byproduct material.

D. What are the production operations, emission sources, and available controls?

As noted above, uranium recovery and processing currently occurs by one of three methods: (1) conventional milling; (2) in-situ leach (ISL); and (3) heap leach. Below we present a brief explanation of the various uranium recovery methods and the usual structures that contain uranium byproduct materials.

(1) Conventional Mills.

Conventional milling is one of the two primary recovery methods that are currently used to extract uranium from uranium-bearing ore. Conventional mills are typically located in areas of low population density. Only one conventional mill in the United States is currently operating; all others are in standby, in decommissioning (closure) or have been decommissioned.

A conventional uranium mill is a chemical plant that extracts uranium using the following process:

(A) Trucks deliver uranium ore to the mill, where it is crushed before the uranium is extracted through a leaching process. In most cases, sulfuric acid is the leaching agent, but alkaline solutions can also be used to leach the uranium from the ore. The process generally extracts 90 to 95 percent of the uranium from the ore.

(B) The mill then concentrates the extracted uranium to produce a uranium oxide material which is called "yellowcake" because of its yellowish color.[4]

(C) Finally, the yellowcake is transported to a uranium conversion facility where it is processed through the stages of the nuclear fuel cycle to produce fuel for use in nuclear power reactors.

(D) The extraction process in (A) and (B) above produces both solid and liquid wastes (i.e., uranium byproduct material, or "tailings") which are transported from the extraction location to an on-site tailings impoundment or a pond for temporary storage.

Uranium byproduct material/tailings are typically created in slurry form during the crushing, leaching and

[4] The term "yellowcake" is still commonly used to refer to this material, although in addition to yellow the uranium oxide material can also be black or grey in color.

concentration processes and are then deposited in an impoundment or "mill tailings pile" which must be carefully monitored and controlled. This is because the mill tailings contain heavy metal ore constituents, including radium. The radium decays to produce radon, which may then be released to the environment. Because radon is a radioactive gas which may be inhaled into the respiratory tract, EPA has determined that exposure to radon and its daughter products contributes to an increased risk of lung cancer. [5]

The holding or evaporation ponds at this type of facility hold liquids containing byproduct material from which HAP emissions are also regulated under Subpart W. These ponds are discussed in more detail in the next section.

(2) In-Situ Leach/Recovery

In-situ leach or recovery sites (ISL/ISR, in this document we will use ISL) represent the majority of the uranium recovery operations that currently exist. The research and development projects and associated pilot projects of the 1980s demonstrated ISL as a viable uranium recovery technique where site conditions (e.g., geology) are amenable to its use. Economically, this technology

[5] http://www.epa.gov/radon/risk_assessment.html.

produces a better return on the investment dollar (EPA-HQ-OAR-2008-0218-0087); therefore, the cost to produce uranium is more favorable to investors. Due to this, the trend in uranium production has been toward the ISL process.

In-situ leaching is defined as the underground leaching or recovery of uranium from the host rock (typically sandstone) by chemicals, followed by recovery of uranium at the surface. Leaching, or more correctly the re-mobilization of uranium into solution, is accomplished through the underground injection of a lixiviant (described below) into the host rock (i.e., ore body) through wells that are connected to the ore formation. A lixiviant is a chemical solution used to extract (or leach) uranium from underground ore bodies.

The injection of a lixiviant essentially reverses the geochemical reactions that resulted in the formation of the uranium deposit. The lixiviant assures that the dissolved uranium, as well as other metals, remains in the solution while it is collected from the ore zone by recovery wells, which pump the solution to the surface. At the surface, the uranium is recovered in an ion-exchange column and further processed into yellowcake. The yellowcake is packaged and transported to a uranium conversion facility where it is

processed through the stages of the nuclear fuel cycle to produce fuel for use in nuclear power reactors.

Two types of lixiviant solutions can be used, loosely defined as "acid" or "alkaline" systems. In the U.S., the geology and geochemistry of the majority of the uranium ore bodies favors the use of alkaline lixiviants such as bicarbonate-carbonate lixiviant and oxygen. Other factors in the choice of the lixiviant are the uranium recovery efficiencies, operating costs, and the ability to achieve satisfactory ground-water restoration.

After processing, lixiviant is recharged (more carbonate/bicarbonate or dissolved carbon dioxide is added to the solution) and pumped back down into the formation for reuse in extracting more uranium. However, a small amount of this liquid is held back from reinjection to maintain a proper hydraulic gradient[6] within the wellfield. The amount of liquid held back is a function of the characteristics of the formation properties (e.g., permeability, hydraulic conductivity, transmissivity). This excess liquid is sent to an impoundment (often called an evaporation pond or holding pond) on site or injected into a deep well for disposal. These impoundments, since they

[6] The hydraulic gradient determines which direction water in the formation will flow, which in this case limits the amount of water that migrates away from the ore zone.

contain uranium byproduct material, are subject to the requirements of Subpart W.[7] With respect to the lixiviant reinjected into the wellfield, there is a possibility of the lixiviant spreading beyond the zone of the uranium deposit (excursion), and this produces a threat of ground-water contamination. The operator of the ISL facility remediates any excursion by pumping large amounts of water in or out of the formation (at various wells) to contain the excursion, and this water (often containing byproduct material either before or after injection into or withdrawal from the formation) is often stored in the evaporation or holding ponds.[8] Although the excursion control operation itself is not regulated under Subpart W, the ponds that contain byproduct material are regulated under that subpart, since they are a potential source of radon emissions. After the ore body has been depleted, restoration of the formation (attempting to return the formation back to its original geochemical and geophysical properties) is accomplished by flushing the host rock with water and sometimes additional chemicals. Since small amounts of uranium are still contained in the returning

[7] As described later in this preamble, the design requirements for these impoundments are derived from the RCRA requirements for impoundments.
[8] By controlling the hydraulic gradient of the formation the operator controls the direction of flow of water, containing the water within specified limits of the formation.

water, the restoration fluids are also considered byproduct material, and are usually sent to evaporation ponds for disposition.

(3) Heap Leaching

In addition to conventional uranium milling and ISL, some facilities may use an extraction method known as heap leaching. In some instances uranium ore is of such low grade, or the geology of the ore body is such that it is not cost-effective to remove the uranium via conventional milling or through ISL.[9] In this case a heap leaching method may be utilized.

No such facilities currently operate to recover uranium in the U.S. However, there are plans for at least one facility to open in the U.S. within the next few years. Heap leach operations involve the following process:

A. Small pieces of ore are placed in a large pile, or "heap," on an impervious geosynthetic liner with perforated pipes under the heap. For the purposes of Subpart W the impervious pad will meet the requirements for design and construction of impoundments found at 40 CFR 192.32 (a).

---

[9] The ore grade is so low that it is not practical to invest large sums of capital to extract the uranium. Heap leach is a much more passive and relatively inexpensive system.

B. An acidic solution is then sprayed[10] over the ore to dissolve the uranium it contains.

C. The uranium-rich solution drains into the perforated pipes, where it is collected and transferred to an ion-exchange system.

D. The heap is "rested," meaning that there is a temporary cessation of application of acidic solution to allow for oxidation of the ore before leaching begins again.

E. The ion-exchange system extracts the uranium from solution where it is later processed into a yellowcake.[11]

F. Once the uranium has been extracted, the remaining solution still contains small amounts of uranium byproduct material (the extraction process is not 100% effective), and this solution is either piped to the heap leach pile to be reused or piped to an evaporation or holding pond. In the evaporation pond it is subject to the Subpart W requirements.

---

[10] Other technology includes drip systems, sometimes used at gold extraction heaps, and flooding of the heap leach pile.

[11] It is our understanding that either ion-exchange or solvent extraction techniques can be used to recover uranium at heap leach facilities. The decision to use one type or the other depends largely on the quality of the ore at a particular site.

G. The yellowcake is transported to a uranium conversion facility where it is processed through the stages of the nuclear fuel cycle to produce fuel for use in nuclear power reactors.
H. Finally, there is a final drain down of the heap solutions, as well as a possible rinsing of the heap. These solutions will contain byproduct material and will be piped to evaporation or holding ponds, where they become subject to the Subpart W requirements. The heap leach pile will be closed in place according to the requirements of 40 CFR 192.32.

Today we are proposing to regulate the HAP emissions from heap leach uranium extraction under Subpart W, in addition to conventional impoundments and evaporation ponds, which are already regulated under this Subpart. Our rationale (explained in greater detail in Section IV.D.4.) is that from the moment uranium extraction takes place in the heap, uranium byproduct material is left behind. Therefore the byproduct material must be managed with the same design as a conventional impoundment, with a liner and leak detection system prescribed at 40 CFR 192.32(a), and an effective method of limiting radon emissions while the heap leach pile is being used to extract uranium.

As described above, there may also be holding or evaporation ponds at this type of facility. In many cases these ponds hold liquids containing byproduct material. The byproduct material is contained in the liquids used to leach uranium from the ore in the heap leach pile as well as draining the heap leach pile in preparation for closure. The HAP emissions from these fluids are currently regulated under Subpart W.

E. What are the existing requirements under Subpart W?

Subpart W was promulgated on December 15, 1989 (54 FR 51654). At the time of promulgation the predominant form of uranium recovery was through the use of conventional mills. There are two separate standards required in Subpart W. The first standard is for "existing" impoundments, e.g., those in existence and licensed by the NRC (or it's Agreement States) on or prior to December 15, 1989. Owners or operators of existing tailings impoundments must ensure that emissions from those impoundments do not exceed a radon (Rn-222) flux standard of 20 picocuries per meter squared per second ($pCi/m^2/sec$). As stated at the time of promulgation: "This rule will have the practical effect of requiring the mill owners to keep their piles wet or

covered.[12]" Keeping the piles (impoundments) wet or covered with soil would reduce radon emissions to a level that would meet the standard. This is still considered an effective method to reduce radon emissions at all uranium tailings impoundments.

The method for monitoring for compliance with the radon flux standard was prescribed as Method 115, found at 40 CFR part 61, Appendix B. The owners or operators of existing impoundments must report to EPA the results of the compliance testing for any calendar year by no later than March 31 of the following year.

There is currently one existing operating mill with impoundments that pre-date December 15, 1989, and two mills that are currently in standby mode.

The second standard applies to "new" impoundments designed and/or constructed after December 15, 1989. The requirements applicable to new impoundments are work practice standards that regulate either the size and number of impoundments, or the amount of tailings that may remain uncovered at any time. 40 CFR 61.252(b) states that no new tailings impoundment can be built after December 15, 1989,

[12] See 54 FR 51689.

unless it is designed, constructed and operated to meet one of the following two work practices:

1. Phased disposal in lined impoundments that are no more than 40 acres in area, and meet the requirements of 40 CFR 192.32(a) as determined by the NRC. The owner or operator shall have no more than two impoundments, including existing impoundments, in operation at any one time.
2. Continuous disposal of tailings that are dewatered and immediately disposed with no more than 10 acres uncovered at any time, and operated in accordance with 40 CFR 192.32(a) as determined by the NRC.

The basis of the work practice standards is to (1) limit the size of the impoundment, which limits the radon source; or (2) utilize the continuous disposal system, which prohibits large accumulations of uncovered tailings, limiting the amount of radon released.

The work practice standards described above were promulgated after EPA considered a number of factors that influence the emissions of Rn-222 from tailings impoundments, including the climate and the size of the impoundment. For example, for a given concentration of Ra-226 in the tailings, and a given grain size of the

tailings, the moisture content of the tailings will control the radon emission rate; the higher the moisture content the lower the emission rate. In the arid and semi-arid areas of the country where most impoundments are located or proposed, the annual evaporation rate is quite high. As a result, the exposed tailings (absent controls like sprinkling) dry rapidly. In previous assessments, we explicitly took the fact of rapid drying into account by using a Rn-222 flux rate of 1 $pCi/m^2/s$ per pCi/g Ra-226 to estimate the Rn-222 source term from the dry areas of the impoundments. (Note: The estimated source terms from the ponded (areas completely covered by liquid) and saturated areas of the impoundments are considered to be zero, reflecting the complete attenuation of the Rn-222).

Another factor we considered was the area of the impoundment, which has a direct linear relationship with the Rn-222 source term, more so than the depth or volume of the impoundment. Again, assuming the same Ra-226 concentration and grain sizes in the tailings, a 100-acre dry impoundment will emit 10 times the radon of a 10-acre dry impoundment. This linear relationship between size and Rn-222 source term is one of the main reasons that Subpart W imposed size restrictions on all future impoundments (40

acres per impoundment if phased disposal is chosen and 10 acres total uncovered if continuous disposal is chosen).

Subpart W also mandates that all tailings impoundments at uranium recovery facilities comply with the requirements at 40 CFR 192.32(a). EPA explained the reason for adding this requirement in the preamble as follows:

> "EPA recognizes that in the case of a tailings pile which is not synthetically or clay lined (the clay lining can be the result of natural conditions at the site) water placed on the tailings in an amount necessary to reduce radon levels, can result in ground water contamination. In addition, in certain situations the water can run off and contaminate surface water. EPA cannot allow a situation where the reduction of radon emissions comes at the expense of increased pollution of the ground or surface water. Therefore, all piles will be required to meet the requirements of 40 CFR 192.32(a) which protects water supplies from contamination. Under the current rules, existing piles are exempt from these provisions, this rule will end that exemption."

54 FR 51654, 51680 (December 15, 1989). Therefore, all impoundments are required to meet the requirements at 40 CFR 192.32(a).

Section 192.32(a) includes a cross-reference to the surface impoundment design and construction requirements of hazardous waste surface impoundments regulated under the Resource Conservation and Recovery Act (RCRA), found at 40 CFR 264.221. Those requirements state that the impoundment shall be designed, constructed and installed to prevent any migration of wastes out of the impoundment to the adjacent

subsurface soil or ground water or surface water at any time during the active life of the impoundment. Briefly, 40 CFR 264.221(c) requires that the liner system must include:

1. A top liner designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into the liner during the active life of the unit.
2. A composite bottom liner consisting of at least two components. The upper component must be designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into this component during the active life of the unit. The lower component must be designed and constructed of materials to minimize the migration of hazardous constituents if a breach in the upper component were to occur. The lower component must be constructed of at least three feet of compacted soil material with a hydraulic conductivity of no more than 1×10^{-7} cm/sec.
3. A leachate collection and removal system between the liners, which acts as a leak detection system. This system must be capable of detecting, collecting and removing hazardous constituents at the earliest practicable time through all areas of the top liner

likely to be exposed to the waste or liquids in the impoundment.

There are other requirements for the design and operation of the impoundment, and these include construction specifications, slope requirements, sump and liquid removal requirements.[13]

F. How did we gather information for this proposed rule?

This section describes the information we used as the basis for making the determination to revise Subpart W. We collected this information using various methods. We performed literature searches, where appropriate, of the engineering methods used by existing uranium recovery facilities in the United States as well as the rest of the world. We used this information to determine whether the technology used to contain uranium byproduct material had advanced since the time of the original promulgation of Subpart W. We reviewed and compiled a list of existing and proposed uranium recovery facilities and the containment technologies being used, as well as those proposed to be used. We compared and contrasted those technologies with the engineering requirements of hazardous waste surface impoundments regulated under Subtitle C of the Resource

[13] For detailed information on the design and operating requirements, refer to 40 CFR Part 264 Subpart K – Surface Impoundments.

Conservation and Recovery Act (RCRA), which are used as the design basis for existing uranium byproduct material impoundments.

We collected information on existing uranium mills and in-situ leach facilities by issuing information collection requests authorized under section 114(a) of the CAA to seven uranium recovery facilities. At the time, this represented 100% of existing facilities. Since then, Cotter Corp. has closed its Cañon City facility. These requests required uranium recovery companies to provide detailed information about the uranium mill and/or in-situ leaching facility, as well as the number, sizes and types of affected sources (tailings impoundments, evaporation ponds and collection ponds) that now or in the past held uranium byproduct material. We requested information on the history of operation since 1975, ownership changes, whether the operation was in standby mode and whether plans existed for new facilities or reactivated operations were expected.[14] We also reviewed the regulatory history of Subpart W and the radon measurement methods used to determine compliance with the existing standards. Below is a synopsis of the information we collected and our analyses.

[14] Section 114(a) letters and responses can be found at http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html.

1. Pre-1989 Conventional Mill Impoundments

We have been able to identify three facilities, either operating or on standby,[15] that have been in operation since before the promulgation of Subpart W in 1989. These existing facilities must ensure that emissions from their operational, pre-1989 impoundments[16] not exceed a radon (Rn-222) flux standard of 20 $pCi/m^2/sec$. The method for monitoring for compliance with the radon flux standard was prescribed as Method 115, found at 40 CFR part 61, Appendix B. These facilities must also meet the requirements in 40 CFR 61.252(c), which cross-references the requirements of 40 CFR 192.32(a).

The White Mesa Conventional Mill in Blanding, Utah, has one pre-1989 impoundment (known by the company as Cell 3) that is currently in operation and near capacity but is still authorized and continues to receive tailings. The company is now pumping any residual free solution out of the cell and contouring the sands. It will then be determined whether any more solids need to be added to the

[15] "Standby" is when a facility impoundment is licensed for the continued placement of tailings/byproduct material but is currently not receiving tailings/byproduct material. See Section V.A. for a discussion of this definition that we are proposing to add to Subpart W.

[16] In this preamble when we use the generic term "impoundment," we are using the term as described by industry.

cell to fill it to the specified final elevation. It is expected to close in the near future (EPA-HQ-OAR-2008-0218-0069). The mill also uses an impoundment constructed before 1989 as an evaporation pond (known as Cell 1). To the extent this evaporation pond contains byproduct material, its HAP emissions are also regulated by Subpart W.

The Sweetwater conventional mill is located 42 miles northwest of Rawlins, Wyoming. The mill operated for a short time in the 1980s and is currently in standby status. Annual radon values collected by the facility indicate that there is little measurable radon flux from the mill tailings that are currently in the lined impoundment. This monitoring program remains active at the facility. According to company records, of the 37 acres of tailings, approximately 28.3 acres of tailings are covered with soil; the remainder of the tailings are continuously covered with water. The dry tailings have an earthen cover that is maintained as needed. During each monitoring event one hundred radon flux measurements are taken on the tailings continuously covered by soil, as required by Method 115 for compliance with Subpart W. The mean radon flux for the exposed tailings over the past 21 years was 3.5 pCi/m^2/sec. The radon flux for the entire tailings impoundment was calculated to be 6.01 pCi/m^2/sec. The calculated radon flux

from the entire tailings impoundment surface is thus approximately 30% of the 20.0 pCi/m^2/sec standard (EPA-HQ-OAR-2008-0218-0087).

The Shootaring Canyon project is a conventional mill located about 3 miles north of Ticaboo, Utah, in Garfield County. The approximately 1,900-acre site includes an ore pad, a small milling building, and a tailings impoundment system that is partially constructed. The mill operated for a very short period of time. Shootaring Canyon did pre-date the standard, but the mill was shut down prior to the promulgation of the standard. The impoundment is in a standby status and has an active license administered by the Utah Department of Environmental Quality, Division of Radiation Control. The future plans for this uranium recovery operation are unknown. Current activities at this remote site consist of intermittent environmental monitoring by consultants to the parent company (EPA-HQ-OAR-2008-0218-0087).

The Shootaring Canyon mill operated for approximately 30 days. Tailings were deposited in a portion of the upper impoundment. A lower impoundment was conceptually designed but has not been built. Milling operations in 1982 produced 25,000 cubic yards of tailings, deposited in a 2,508 m^2 (0.62 acres) area. The tailings are dry except for moisture

associated with occasional precipitation events; consequently, there are no beaches[17]. The tailings have a soil cover that is maintained by the operating company. Radon sampling for the 2010 year took place in April. Again, one hundred radon flux measurements were collected. The average radon flux from this sampling event was 11.9 pCi/m^2-sec.

A fourth mill is Cotter Corporation in Cañon City, Colorado. The mill no longer exists, and the pre-1989 impoundments are in closure.

2. 1989-Present Conventional Mill Impoundments

There currently is only one operating conventional mill with an impoundment that was constructed after December 15, 1989. The White Mesa conventional mill in Utah has two impoundments (Cell 4A and Cell 4B: Cell 4A is currently operating as a conventional impoundment and Cell 4B is being used as an evaporation pond) designed and constructed after 1989. The facility uses the phased disposal work practice.

There are several conventional mills in the planning and/or permitting stage and conventional impoundments at

[17] The term "beaches" refers to portions of the tailings impoundment where the tailings are wet but not saturated or covered with liquids.

these mills will be required to utilize one of the current work practice standards.

3. In-Situ Leach Facilities

After 1989 the price of uranium began to fall, and the uranium mining and milling industry essentially collapsed, with very few operations remaining in business. However, several years ago the price of uranium began to rise so that it became profitable once more for companies to consider uranium recovery. ISL has become the preferred choice for uranium extraction where suitable geologic conditions exist.

Currently there are five ISL facilities in operation: (1) the Alta Mesa project in Brooks County, Texas; (2) the Crow Butte Operation in Dawes County, Nebraska; (3) the Hobson/La Palangana Operation in South Texas; (4) the Willow Creek (formerly Christensen Ranch/Irigaray Ranch) Operation in Wyoming; and (5) the Smith Ranch-Highland Operation in Converse County, Wyoming.[18] These facilities use or have used evaporation ponds to hold back liquids containing uranium byproduct material from reinjection to maintain a proper hydraulic gradient within the wellfield.[19]

[18] Source: U.S. Energy Information Administration, http://www.eia.gov/uranium/production/quarterly/html/qupd_tbl4.html.

[19] The Alta Mesa operation uses deep well injection rather than evaporation ponds.

These ponds are subject to the Subpart W requirements and range in size from less than an acre to up to 40 acres. Based on the information provided to us the ponds meet the requirements of 40 CFR 61.252(c).

There are approximately 11 additional ISL facilities in various stages of licensing or on standby. It is anticipated that there could be approximately another 20-30 license applications over the next 5-10 years.[20]

4. Heap Leach Facilities

As stated earlier, there are currently no operating heap leach facilities in the United States. We are aware of two or three potential future operations. The project most advanced in the application process is the Sheep Mountain facility in Wyoming. Energy Fuels has announced its intent to submit a license application to the NRC in March 2014. One or two other as yet to be determined operations may be located in Lander County, Nevada and/or a site in New Mexico.[21]

[21] http://www.nrc.gov/materials/uranium-recovery/license-apps/ur-projects-list-public.pdf.

5. Flux Requirement versus Management Practices for Conventional Impoundments in operation before December 15, 1989.

In performing our analysis we considered the information we received from all the existing conventional impoundments. We also looked at the compliance history of the existing conventional impoundments. After this review we considered two specific questions: 1) Are any of the conventional impoundments using any novel methods to reduce radon emissions? 2) Is there now any reason to believe that any of the existing conventional impoundments could not comply with the management practices for new conventional impoundments, in which case would we need to continue to make the distinction between conventional impoundments constructed before or after December 15, 1989? We arrived at the following conclusions: First, we are not aware of any conventional impoundment that uses any new or different technologies to reduce radon emissions. Conventional impoundment operators continue to use the standard method of reducing radon emissions by limiting the size of the impoundment and covering tailings with soil or keeping tailings wet. These are very effective methods for limiting the amount of radon released to the environment.

Second, we believe that only one existing operating conventional impoundment designed and in operation before December 15, 1989, could not meet the work practice standards. This impoundment is Cell 3 at the White Mesa mill, which is expected to close in 2014 (Personal communication between EPA staff and Utah Department of Environmental Quality staff, May 16, 2013, EPA-HQ-2008-0218-0081). We were very clear in our 1989 rulemaking that all conventional mill impoundments must meet the requirements of 40 CFR 192.32(a), which, in addition to requiring ground-water monitoring, also required the use of liner systems to ensure there would be no leakage from the impoundment into the ground water. We did this by removing the exemption for existing piles from the 40 CFR 192.32(a) requirements (54 FR 51680). However, we did not require those existing impoundments to meet either the phased disposal or continuous disposal work practice standards, which limit the exposed area and/or number of conventional impoundments, thereby limiting the potential for radon emissions. This is because at the time of promulgation of the rule, conventional impoundments existed that were larger in area than the maximum work practice standard of 40 acres used for the phased disposal work practice, or 10 acres for the continuous disposal requirement. This area

limitation was important in reducing the amount of exposed tailings that were available to emit radon. However, we recognized that by instituting a radon flux standard we would require owners and operators to limit radon emissions from these preexisting impoundments (usually by placing water or soil on exposed portions of the impoundments). The presumption was that conventional impoundments constructed before this date could otherwise be left in a dry and uncovered state, which would allow for unfettered release of radon. The flux standard was promulgated to have the practical effect of requiring owners and operators of these old impoundments to keep their tailings either wet or covered with soil, thereby reducing the amount of radon that could be emitted (54 FR 51680).

We believe that the existing conventional impoundments at both the Shootaring Canyon and Sweetwater facilities can meet the work practice standards in the current Subpart W regulation. The conventional impoundments at both these facilities are less than 40 acres in area and are synthetically lined as per the requirements in 40 CFR 192.32(a). We also have information that the new conventional impoundments operating at the White Mesa mill will utilize the phased work practice standard of limiting conventional impoundments to no more than two, each 40

acres or less in area. We also have information that Cell 3 at the White Mesa facility will be closed in 2014, and the phased disposal work method will be used for the remaining cells. (Personal communication between EPA staff and staff of Utah Department of Environmental Quality, May 16, 2013 (EPA-HQ-2008-0218-0081). As a result, we find there would be no conventional impoundment designed or constructed before December 15, 1989 that could not meet a work practice standard. Since the conventional impoundments in existence prior to December 15, 1989 appear to meet the work practice standards, we are proposing to eliminate the distinction of whether the conventional impoundment was constructed before or after December 15, 1989. We are also proposing that all conventional impoundments (including those in existence prior to December 15, 1989) must meet the requirements of one of the two work practice standards, and that the flux standard of 20 pCi/m^2/sec will no longer be required for the impoundments in existence prior to December 15, 1989.

G. How does this action relate to other EPA standards?

Under the CAA, EPA promulgated Subpart W, which includes standards and other requirements for controlling radon emissions from operating mill tailings at uranium recovery facilities. Under our authority in the Uranium Mill

Tailings Radiation Control Act of 1978 (UMTRCA), we have also issued standards that are more broadly applicable to uranium and thorium byproduct materials at active and inactive uranium recovery facilities. NRC (or Agreement States[22]) and DOE implement and enforce these standards at these uranium recovery facilities as directed by UMTRCA. These standards, located in 40 CFR part 192, address the radiological and non-radiological hazards of uranium and thorium byproduct materials in ground water and soil, in addition to air. For the non-radiological hazards, UMTRCA directed us to promulgate standards consistent with those used by EPA to regulate non-radiological hazardous materials under RCRA. Therefore, our part 192 standards incorporate the ground-water protection requirements applied to hazardous waste management units under RCRA and specify the placement of uranium or thorium byproduct materials in impoundments constructed in accordance with RCRA requirements. Radon emissions from non-operational impoundments (i.e., those with final covers) are limited in

---

[22] An Agreement State is a State that has entered into an agreement with the Nuclear Regulatory Commission under section 274 of the Atomic Energy Act of 1954 (42 U.S.C. 2021)and has authority to regulate byproduct materials (as defined in section 11e.(2)of the Atomic Energy Act)and the disposal of low-level radioactive waste under such agreement.

40 CFR part 192 to the emissions levels of 20 pCi/m^2/sec. We are currently preparing a regulatory proposal to update provisions of 40 CFR part 192, with emphasis on ground-water protection for ISL facilities. As explained in previous sections, Subpart W currently contains reference to some of the part 192 standards.

H. Why did we conduct an updated Risk Assessment?

While not required by or conducted as part of our GACT analysis, one of the tasks we performed for our own purposes was to update the risk analysis we performed when we promulgated Subpart W in 1989. We performed a comparison between the 1989 risk assessment and current risk assessment approaches, focusing on the adequacy and the appropriateness of the original assessments. We did this for informational purposes only and not for or as part of our GACT analysis. Instead, we prepared this updated risk assessment because we wanted to demonstrate that even using updated risk analysis procedures (i.e. using procedures updated from those used in the 1980s), the existing radon flux standard appears to be protective of the public health and the environment. We did this by using the information we collected to perform new risk assessments for existing facilities, as well as two idealized "generic" sites, one located in the eastern half of the United States and one

located in the southwest United States. (These two model sites do not exist. They are idealized using representative features of mills in differing climate and geography). This information has been collected into one document[23] that has been placed in the docket (EPA-HQ-OAR-2008-0218-0087) for this proposed rulemaking.

As part of this work, we evaluated various computer models that could be used to calculate the doses and risks due to the operation of conventional and ISL uranium recovery facilities, and selected CAP88 V 3.0 for use in this analysis. CAP88 V 3.0 was developed in 1988 from the AIRDOS, RADRISK, and DARTAB computer programs, which had been developed for the EPA at the Oak Ridge National Laboratory (ORNL).

CAP88 V 3.0, which stands for “Clean Air Act Assessment Package-1988 version 3.0,” is used to demonstrate compliance with the NESHAP requirements applicable to radionuclides. CAP88 V 3.0 calculates the doses and risk to a designated receptor as well as to the surrounding population. Exposure pathways evaluated by CAP88 V 3.0 are: inhalation, air immersion, ingestion of

---

[23] Technical and Regulatory Support to Develop a Rulemaking to Potentially Modify the NESHAP Subpart W Standard for Radon Emissions from Operating Uranium Mills (40 CFR 61.250).

vegetables, meat, and milk, and ground surface exposure. CAP88 V 3.0 uses a modified Gaussian plume equation to estimate the average dispersion of radionuclides released from up to six emitting sources. The sources may be either elevated stacks, such as a smokestack, or uniform area sources, such as the surface of a uranium byproduct material impoundment. Plume rise can be calculated assuming either a momentum or buoyant-driven plume.

At several sites analyzed in this evaluation only site-wide releases of radon were available to us. This assessment was limited by the level of detail provided by owners and operators of uranium recovery facilities. In instances where more specific site data were available, site-wide radon releases were used as a bounding estimate. Assessments are done for a circular grid of distances and directions for a radius of up to 80 kilometers (50 miles) around the facility. The Gaussian plume model produces results that agree with experimental data as well as any comparable model, is fairly easy to work with, and is consistent with the random nature of turbulence. A description of CAP88 V 3.0 and the computer models upon

which it is based is provided in the CAP88 V 3.0 Users Manual.[24]

The uranium recovery facilities that we analyzed included three existing conventional mills (Cotter, White Mesa and Sweetwater), five operating ISL operations (the Alta Mesa project in Brooks County, Texas; the Crow Butte Operation in Dawes County, Nebraska; the Hobson/La Palangana Operation in South Texas; the Willow Creek (formerly Christensen Ranch/Irigaray Ranch) Operation in Wyoming; and the Smith Ranch-Highland Operation in Converse County, Wyoming), and two generic sites assumed for the location of conventional mills (we chose conventional mills because we believe they have the potential for greater radon emissions). One generic site was modeled in the southwest United States (Western Generic) while the other was assumed to be located in the eastern United States (Eastern Generic).[25] An Eastern generic site was selected for the second generic site to accommodate the recognition that a number of uranium recovery facilities are expected to apply for construction licenses in the future, and to determine potential risks in geographic areas of the U.S. that customarily have not hosted uranium recovery

---

[24] http://www.epa.gov/radiation/assessment/CAP88 V 3.0/index.html.
[25] There is a potential in the future for uranium recovery in areas like south-central Virginia.

facilities. For this assessment the conventional mills we were most interested in were the White Mesa mill and the Sweetwater mill. (The Shootaring Canyon mill was not analyzed, because the impoundment is very small and is soil covered, and the Cotter facility is now in closure). These conventional mills are either in operation or standby and are subject to the flux standard of 20 $pCi/m^2/sec$. The risk analyses performed for these two mills showed that the maximum lifetime cancer risks from radon emissions from the White Mesa impoundments were 1.1×10^{-4} while the maximum lifetime cancer risks from radon associated with the impoundments at the Sweetwater mill were 2.4×10^{-5}. As we indicated in our original 1989 risk assessment, in protecting public health, EPA strives to provide the maximum feasible protection by limiting lifetime cancer risk from radon exposure to approximately 1 in 10,000 (i.e., 10^{-4})[26]. The analyses also estimated that the total cancer risk to the populations surrounding all ten modeled uranium sites (i.e., total cancer fatalities) is between 0.0015 and 0.0026 fatal cancers per year, or approximately 1 case every 385 to 667 years for the 4 million persons living within 80 km of the uranium recovery facilities.

[26] See 54 FR 51656

Similarly, the total cancer incidence for all ten modeled sites is between 0.0021 and 0.0036 cancers per year, or approximately 1 case every 278 to 476 years. The analyses are described in more detail in the background document generated for this proposal.[27] As stated above, we performed this risk assessment for informational purposes only. The risk assessment was not required or considered during our analysis for proposing GACT standards for uranium recovery facilities (e.g., conventional impoundments, non-conventional impoundments or heap leach piles).

III. Summary of the Proposed Requirements

We are proposing to revise Subpart W to include requirements we have identified that are generally available for controlling radon emissions in a cost-effective manner, and are not currently included in Subpart W. Specifically, we are proposing to require that non-conventional impoundments and heap leach piles must maintain minimum liquid levels to control their radon emissions from these affected sources.

Additionally, we are revising Subpart W to propose GACT standards for the affected sources at conventional

[27] All risks are presented as LCF risks. If it is desired to estimate the morbidity risk, simply multiply the LCF risk by 1.39. For a more detailed analysis of cancer mortality and morbidity, please see the Background Information Document, Docket number EPA-HQ-OAR-0218-0087.

uranium mills, ISL facilities and heap leach facilities. Given the evolution of uranium recovery facilities over the last 20 years, we believe it is appropriate to revise Subpart W to tailor the requirements of the rule to the different types of facilities in existence at this time. We are therefore proposing to revise Subpart W to add appropriate definitions, standards and other requirements that are applicable to HAP emissions at these uranium recovery facilities.

Our experience with ensuring that uranium recovery facilities are in compliance with Subpart W also leads us to propose three more changes. First, we are proposing to remove certain monitoring requirements that we believe are no longer necessary for demonstrating compliance with the proposed GACT standards. Second, we are proposing to revise certain definitions so that owners and operators clearly understand when Subpart W applies to their facility. Third, we are proposing to clarify what specific liner requirements must be met under Subpart W.[28]

[28] Under its CAA authority, EPA requires facilities subject to Subpart W to build impoundments in a manner that complies with the requirements found in 40 CFR 192. As a matter of convenience, EPA cross-references the part 192 requirements in Subpart W instead of copying them directly into Subpart W. This cross-referencing convention is often used in rulemakings.

Taken altogether, the proposed revisions to Subpart W are appropriate for updating, clarifying and strengthening the management of radon emissions from the uranium byproduct material generated at uranium recovery facilities.

A. What are the affected sources?

Today we are proposing to revise Subpart W to include requirements for affected sources at three types of operating uranium recovery facilities: (1) conventional uranium mills; (2) ISL facilities; and (3) heap leach facilities. The affected sources at these uranium recovery facilities include conventional impoundments, non-conventional impoundments where tailings are contained in ponds and covered by liquids (examples of these affected sources are evaporation or holding ponds that may exist at conventional mills, ISL facilities and heap leach facilities), and heap leach piles. The proposed GACT standards and the rationale for these proposed standards are discussed below and in Section IV. We request comment on all aspects of these proposed requirements.

B. What are the proposed requirements?

1. Conventional impoundments.

In the 1989 promulgation of Subpart W we created two work practice standards, phased disposal and continuous

disposal, for uranium tailings impoundments designed and constructed after December 15, 1989. The work practice standards, which limit the exposed area and/or number of conventional impoundments at a uranium recovery facility, require that these impoundments be no larger than 40 acres (for phased disposal) or 10 uncovered acres (for continuous disposal). We also limited the number of conventional impoundments operating at any one time to two. We took this approach because we recognized that the radon emissions from very large conventional impoundments could impose unacceptable health effects if the piles were left dry and uncovered. The 1989 promulgation also included the requirements in 40 CFR 192.32(a), which include design and construction requirements for the impoundments as well as requirements for prevention and mitigation of ground-water contamination.

As discussed earlier, we no longer believe that a distinction needs to be made for conventional impoundments based on the date when they were designed and/or constructed. We believe that the existing conventional impoundments at both the Shootaring Canyon and Sweetwater facilities can meet the work practice standards in the current Subpart W regulation. The conventional impoundments at both these facilities are less than 40 acres in area and

are synthetically lined as per the requirements in 40 CFR 192.32(a)(1). The existing cell 3 at the White Mesa mill will undergo closure in 2014 and will be replaced with the impoundments currently under construction that meet the phased disposal work practice standard. Therefore, there is no reason not to subject these older impoundments to the work practice standards required for impoundments designed or constructed after December 15, 1989. By incorporating these impoundments under the work practices provision of Subpart W, it is no longer necessary to require radon flux monitoring, and we are proposing to eliminate that requirement.

The proposed elimination of the monitoring requirement in 40 CFR 61.253 applies only to those facilities currently subject to the radon flux standard in 40 CFR 61.252(a), which applies to only the three conventional impoundments in existence prior to the original promulgation of Subpart W on December 15, 1989. While we are proposing to eliminate the radon monitoring requirement for these three impoundments under Subpart W, this action does not relieve the owner or operator of the uranium recovery facility of the monitoring and maintenance requirements of their operating license issued by the NRC or its Agreement States. These requirements are found at 10 CFR Part 40,

Appendix A, Criterion 8 and 8A. Additionally, NRC, through its Regulatory Guide 4.14, may also recommend incorporation of radionuclide air monitoring at operating facility boundaries.

Further, when the impoundments formally close they are subject to the radon monitoring requirements of 40 CFR 192.32(a)(3), also under the NRC licensing requirements.

From a cost standpoint, by not requiring radon monitoring we expect that for all three sites the total annual average cost savings would be $29,200, with a range from about $21,000 to $37,000. More details on economic costs can be found in Section IV.B of this preamble.

For the proposed rule we also evaluated the requirements of 40 CFR 192.32(a) as they pertain to the Subpart W standards. The requirements of 40 CFR 192.32(a) are included in the NRC's regulations and are reviewed for compliance by NRC during the licensing process for a uranium recovery facility. We determined that the requirements at 40 CFR 192.32(a)(1), which reference the RCRA requirements for design and operation of surface impoundments at 40 CFR 264.221, are the only requirements necessary for EPA to incorporate for Subpart W, as they are effective methods of containing tailings and protecting ground water while also limiting radon emissions. This

liner requirement, described earlier in this preamble, remains in use for the permitting of hazardous waste land disposal units under RCRA. The requirements at 40 CFR 192.32(a)(1) contain safeguards to allow for the placement of tailings and yet provide an early warning system in the event of a leak in the liner system. We are therefore proposing to retain the two work practice standards and the requirements of 40 CFR 192.32(a)(1) as GACT for conventional impoundments because these methods for limiting radon emissions while also protecting ground water have proven effective for these types of impoundments.

2. Non-conventional impoundments where tailings are contained in ponds and covered by liquids.

Today we are proposing a GACT standard specifically for non-conventional impoundments where uranium byproduct materials are contained in ponds and covered by liquids. Common names for these structures may include, but are not limited to, impoundments and evaporation or holding ponds. These affected sources may be found at any of the three types of uranium recovery facilities.

These units meet the existing applicability criteria in 40 CFR 61.250 to classify them for regulation under Subpart W. The holding or evaporation ponds located at conventional mills, ISL facilities and potentially heap

leach facilities contain uranium byproduct material, either in solid form or dissolved in solution, and therefore their emissions are regulated under Subpart W. As defined at 40 CFR 61.251(g), uranium byproduct material or tailings means the waste produced by the extraction or concentration of uranium from any ore processed primarily for its source material content. Therefore, emissions for the ponds at uranium recovery facilities that contain either uranium byproduct material in solid form or radionuclides dissolved in liquids are regulated under Subpart W. Today we are again stating that determination and proposing a GACT standard specifically for these impoundments.

Evaporation or holding ponds, while sometimes smaller in area than conventional impoundments, perform a basic task. They hold uranium byproduct material until it can be disposed. Our survey of existing ponds shows that they contain liquids, and, as such, this general practice has been sufficient to limit the amount of radon emitted from the ponds, in many cases, to almost zero. Because of the low potential for radon emissions from these impoundments, we do not believe it is necessary to monitor them for radon emissions. We have found that as long as approximately one meter of liquid is maintained in the pond, the effective radon emissions from the pond are so low that it is

difficult to determine whether there is any contribution above background radon values. EPA has stated in the ***Final Rule for Radon-222 Emissions from Licensed Uranium Mill Tailings: Background Information Document*** (August, 1986):

> "Recent technical assessments of radon emission rates from tailings indicate that radon emissions from tailings covered with less than one meter of water, or merely saturated with water, are about 2% of emissions from dry tailings. Tailings covered with more than one meter of water are estimated to have a zero emissions rate. The Agency believes this calculated difference between 0% and 2% is negligible. The Agency used an emission rate of zero for all tailings covered with water or saturated with water in estimating radon emissions."

Therefore, we are proposing as GACT that these impoundments meet the design and construction requirements of 40 CFR 192.32(a)(1), with no size/area restriction, and that during the active life of the pond at least one meter of liquid be maintained in the pond.

We are also proposing that no monitoring be required for this type of impoundment. We have received information and collected data that show there is no acceptable radon flux test method for a pond holding a large amount of liquid. (Method 115 does not work because a solid surface is needed to place the large area activated carbon canisters used in the Method). Further, even if there was an acceptable method, we recognize that radon emissions

from the pond would be expected to be very low because the liquid acts as an effective barrier to radon emissions; given that radon-222 has a very short half-life (3.8 days), there simply is not enough time for most of the radon produced by the solids or from solution to migrate to the water surface and cross the water/air interface before decaying(EPA-HQ-OAR-2008-0218-0087). It therefore appears that monitoring at these ponds is not necessary for demonstrating compliance with the proposed standards. We do, however, ask for comment and supporting information on three issues: (1) whether these impoundments need to be monitored with regard to their radon emissions, and why; (2) whether these impoundments need to be monitored to ensure at least one meter of liquid is maintained in the pond at all times, and (3) if these impoundments do need monitoring, what methods could a facility use (for example, what types of radon collection devices, or methods to measure liquid levels) at evaporation or holding ponds.

3. Heap Leach Piles.

The final impoundment category for which we are proposing GACT standards is heap leach piles. We are proposing to require that heap leach piles meet the phased disposal work practice standard set out in Section III B. 1. of this preamble (which limits an owner/operator to no

more than two operating heap leach piles of no more than 40 acres each at any time) and the design and construction requirements at 40 CFR 192.32(a)(1) as GACT. We are also requiring heap leach piles to maintain minimum moisture content of 30% so that the byproduct material in the heap leach pile does not dry out, which would increase radon emissions from the heap leach pile.

As noted earlier in the preamble, there are currently no operating uranium heap leach facilities in the United States. We are aware that the one currently proposed heap leach facility will use the design and operating requirements at 40 CFR 192.32(a)(1) for the design of its heap. Since this requirement will be used at the only example we have for a heap leach pile, it (design and operating requirements at 40 CFR 192.32(a)(1)), along with the phased disposal work practice standard (limiting the number and size of heap leach piles), will be the standards that we propose as GACT for heap leach piles. The premise is that the operator of a heap would not want to lose any of the uranium-bearing solution; thus, it is cost effective to maintain a good liner system so that there will be no leakage and ground water will be protected. Also, use of the phased disposal work practice standard will limit the amount of exposed uranium byproduct material that would be

available to emit radon. If we assume that uranium ore (found in the heap leach pile) and the resultant leftover byproduct material after processing emit radon at the same rate as uranium byproduct material in a conventional impoundment (a conservative estimate), we can also assume that the radon emissions will be nearly the same as two 40 acre conventional impoundments.

We recognize that owners and operators of conventional impoundments also limit the amount of radon emitted by keeping the tailings in the impoundments covered, either with soil or liquids. At the same time, however, we recognize that keeping the uranium byproduct material in the heap in a saturated or near-saturated state (in order to reduce radon emissions) is not a practical solution as it would be at a conventional tailings impoundment. In the definitions at 40 CFR 61.251(c) we have defined "dewatered" tailings as those where the water content of the tailings does not exceed 30% by weight. We are proposing today to require operating heaps to maintain moisture content of greater than 30% so that the byproduct material in the heap is not allowed to become dewatered which would allow more radon emissions. We are specifically asking for comment on the amount of liquid that should be required in the heap, and whether the 30% figure is a realistic objective. We are

also asking for comments on precisely where in the heap leach pile this requirement must be met. The heap leach pile may not be evenly saturated during the uranium extraction process. The sprayer/drip system commonly used on the top of heap leach piles usually results in a semi-saturated moisture condition at the top of the pile, since flow of the lixiviant is not uniformly spread across the top of the pile. As downward flow continues, the internal areas of the pile become saturated. We are requesting information and comment on where specifically in the pile the 30% moisture content should apply.

C. What are the monitoring requirements?

As the rule currently exists, only mills with existing conventional impoundments in operation on or prior to December 15, 1989, are currently required to monitor to ensure compliance with the radon flux standard. The reason for this is because at the time of promulgation of the 1989 rule, EPA stated that no flux monitoring would be required for new impoundments because the proposed work practice standards would be effective in reducing radon emissions from operating impoundments by limiting the amount of tailings exposed (54 FR 51681). Since we have now determined that existing older conventional impoundments can meet one of the two work practice standards, we are

proposing to eliminate the radon flux monitoring requirement.

In reviewing Subpart W we looked into whether we should extend radon monitoring to all affected sources constructed and operated after 1989 so that the monitoring requirement would apply to all conventional impoundments, non-conventional impoundments and heap leach piles containing uranium byproduct materials. We also reviewed how this requirement would apply to facilities where Method 115 is not applicable, such as at impoundments totally covered by liquids. We concluded that the original work practice standards (now proposed as GACT) continue to be an effective practice for the limiting of radon emissions from conventional impoundments and from heap leach piles. We also concluded that by maintaining an effective water cover on non-conventional impoundments the radon emissions from those impoundments are so low as to be difficult to differentiate from background radon levels at uranium recovery facilities. Therefore, we are proposing today that it is not necessary to require radon monitoring for any affected sources regulated under Subpart W. We seek comment on our conclusion that radon monitoring is not necessary for any of these sources as well as on any available cost-

effective options for monitoring radon at non-conventional impoundments totally covered by liquids.

D. <u>What are the notification, recordkeeping and reporting requirements?</u>

New and existing affected sources are required to comply with the existing requirements of the General Provisions (40 CFR part 61, subpart A). The General Provisions include specific requirements for notifications, recordkeeping and reporting, including provisions for notification of construction and/or modification and startup as required by 40 CFR 61.07, 61.08 and 61.09.

Today we are also proposing that all affected sources will be required to maintain certain records pertaining to the design, construction and operation of the impoundments, both including conventional impoundments, and nonconventional impoundments, and heap leach piles. We are proposing that these records be retained at the facility and contain information demonstrating that the impoundments and/or heap leach pile meet the requirements in section 192.32(a)(1), including but not limited to, all tests performed that prove the liner is compatible with the material(s) being placed on the liner. For nonconventional impoundments we are proposing that this requirement would also include records showing compliance with the continuous

one meter of liquid in the impoundment;[29] for heap leach piles, we are proposing that this requirement would include records showing that the 30% moisture content of the pile is continuously maintained. Documents showing that the impoundments and/or heap leach pile meet the requirements in section 192.32(a)(1) are already required as part of the pre-construction application submitted under 40 CFR 61.07, so these records should already be available. Records showing compliance with the one meter liquid cover requirement for nonconventional impoundments and records showing compliance with the 30% moisture level required in heap leach piles can be created and stored during the daily inspections of the tailings and waste retention systems required by the NRC (and Agreement States) under the inspection requirements of 10 CFR 40, Appendix A, Criterion 8A.

Because we are proposing new record-keeping requirements for uranium recovery facilities, we are required by the Paperwork Reduction Act (PRA) to prepare an estimate of the burden of such record-keeping on the regulated entity, in both cost and hours necessary to

[29] The one meter liquid requirement pertains to having one meter of liquid cover any and all solid byproduct material. We do not anticipate a large quantity of solid byproduct material in these nonconventional impoundments (EPA-HQ-OAR-2008-0218-0088).

comply with the requirements. We have submitted the Information Collection Request (ICR) containing this burden estimate and other supporting documentation to the Office of Management and Budget (OMB). See Section VII.B for more discussion of the PRA and ICR.

We believe the record-keeping requirements proposed today will not create a significant burden for operators of uranium recovery facilities. As described earlier, we are proposing to require retention of three types of records: (1) records demonstrating that the impoundments and/or heap leach pile meet the requirements in section 192.32(a)(1) (e.g. the design and liner testing information); (2) records showing that one meter of water is maintained to cover the byproduct material stored in nonconventional impoundments; and (3) records showing that heap leach piles maintain a moisture content of at least 30%.

Documents demonstrating that the affected sources comply with section 192.32(a)(1) requirements are necessary for the facility to obtain regulatory approval from NRC (or an NRC Agreement State) and EPA to construct and operate the affected sources (this includes any revisions during the period of operations). Therefore, these records will exist independent of Subpart W requirements and will not need to be continually updated as a result of this record-

keeping requirement in Subpart W; however, we are proposing to include this record-keeping requirement in Subpart W to require that the records be maintained at the facility during its operational lifetime (in some cases the records might be stored at a location away from the facility, such as corporate offices). This might necessitate creating copies of the original records and providing a location for storing them at the facility.

Keeping a record to provide confirmation that water to a depth of one meter is maintained above the byproduct material stored in nonconventional impoundments should also be relatively straightforward. This would involve placement of a measuring device or devices in or at the edge of the impoundment to allow observation of the water level relative to the level of byproduct material in the impoundment. Such devices need not be highly technical and might consist of, for example, measuring sticks with easily-observable markings placed at various locations, or marking the sides of the impoundment to illustrate different water depths. As noted earlier, NRC and Agreement State licenses require operators to inspect the facility on a daily basis. Limited effort should be necessary to make observations of water depth and record the information in

inspection log books that are already kept on site and available to inspectors.

Similarly, daily inspections would provide a mechanism for recording moisture content of heap leach piles. However, because no heap leach facilities are currently operating, there is more uncertainty about exactly how the operator will determine that the heap has maintained a 30% moisture content. As discussed in more detail in Section IV.E.4 of this preamble, soil moisture probes are readily available and could be used for this purpose. Such probes could be either left in the heap leach pile, placed at locations that provide a representative estimate for the heap as a whole, or facility personnel could use handheld probes to collect readings. The facility might also employ mass-balance estimates to provide a further check on the data collected.

We estimate the burden in hours and cost for uranium recovery facilities to comply with the proposed recordkeeping requirements are as follows:

Table 1: Burden Hours and Costs for Proposed Recordkeeping Requirements (Annual figures except where noted)

Activity	Hours	Costs
Maintaining Records for the section 192.32(a)(1) requirements	20*	$1,360*

Verifying the one meter liquid requirement for nonconventional impoundments	288	$12,958
Verifying the 30% moisture content at heap leach piles using multiple soil probes	2,068	$86,548

*These figures represent a one-time cost to the facility.

Burden levels for heap leach piles are most uncertain because they depend on the chosen method of measurement (e.g., purchasing and maintaining multiple probes or a smaller number of handheld units) as well as the personnel training involved (e.g., a person using a handheld unit will likely need more training than someone who is simply recording readings from already-placed probes). We request comment on our estimates of burden, as well as suggestions of methods that could readily and efficiently be used to collect the required information. More discussion of the ICR and opportunities for comment may be found in Section VII.B.

E. When must I comply with these proposed standards?

All existing affected sources subject to this proposed rule would be required to comply with the rule requirements upon the date of publication of the final rule in the Federal Register. To our knowledge, there is no existing operating uranium recovery facility that would be required

to modify its affected sources to meet the requirements of the final rule; however, we request any information regarding affected sources that would not meet these requirements. New sources would be required to comply with these rule requirements upon the date of publication of the final rule in the Federal Register or upon startup of the facility, whichever is later.

IV. Rationale for this Proposed Rule

A. How did we determine GACT?

As provided in CAA section 112(d)(5), we are proposing standards representing GACT for this area source category. In developing the proposed GACT standards, we evaluated the control technologies and management practices that are available to reduce HAP emissions from the affected sources and identified those that are generally available and utilized by operating uranium recovery facilities.

As noted in Section II.F., for this proposal we solicited information on the available controls and management practices for this area source category using written facility surveys (surveys authorized by section 114(a) of the CAA), reviews of published literature, and reviews of existing facilities (EPA-HQ-OAR-0218-0066). We also held discussions with trade association and industry representatives and other stakeholders at various public

meetings.[30] Our determination of GACT is based on this information. We also considered costs and economic impacts in determining GACT (See Section VI.).

We identified two general management practices that reduce radon emissions from affected sources. These general management practices are currently being used at all existing uranium recovery facilities. First, limiting the area of exposed tailings in conventional impoundments limits the amount of radon that can be emitted. The work practice standards currently included in Subpart W require owners and operators of affected sources to implement this management practice by either limiting the number and area of existing, operating impoundments or covering dewatered tailings to allow for no more than 10 acres of exposed tailings. This is an existing requirement of Subpart W and of the NRC licensing requirements; hence, owners and operators of uranium recovery facilities are already incurring the costs associated with limiting the area of conventional impoundments (and as proposed, heap leach piles) to 40 acres or less (as well as no more than two conventional impoundments in operation at any one time), or

[30] See http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html for a list of presentations made at public meetings held by EPA and at various conferences open to the public.

limiting the area of exposed tailings to no more than 10 acres.

Second, covering uranium byproduct materials with liquids is a general management practice that is an effective method for limiting radon emissions. This general management practice is often used at nonconventional impoundments, which, as stated earlier, are also known as evaporation or holding ponds. These nonconventional impoundments also contain byproduct material, and thus their HAP emissions are regulated under Subpart W. They are also regulated under the NRC operating license. While they hold mostly liquids, they are still designed and constructed in the manner of conventional impoundments, meaning they meet the requirements of section 192.32(a)(1). While this management practice of covering uranium byproduct materials in impoundments with liquids is not currently required under Subpart W, facilities using this practice have generally shown its effectiveness in reducing emissions in both conventional impoundments (that make use of phased disposal) and nonconventional impoundments (i.e. holding or evaporation ponds). We are therefore proposing to require the use of liquids in nonconventional impoundments as a way to limit radon emissions.

Therefore, after review of the available information and from the evidence we have examined, we have determined that a combination of the management practices listed above will be effective in limiting radon emissions from this source category, and will do so in a cost effective manner. We also believe that since heap leach piles are in many ways similar to the design of conventional impoundments, the same combination of work practices (limitation to no more than two operating heap leach piles, each one no more than 40 acres) will limit radon emissions in heap leach piles. We discuss our reasons supporting these conclusions in more detail in Section IV.B.

B. Proposed GACT standards for operating mill tailings.

1. Requirements at 40 CFR 192.32(a)(1)

As an initial matter, we determined that the requirements at 40 CFR 192.32(a)(1), which reference the RCRA requirements for the design and construction of liners at 40 CFR 264.221, continue to be an effective method of containment of tailings for all types of affected sources (EPA-HQ-OAR-2008-0218-0015). The liner requirements, described earlier in this document, remain in use for the permitting of hazardous waste land disposal units under RCRA. Because of the requirement for nearly impermeable boundaries between the tailings and the subsurface, and the

requirement for leak detection between the liners, we have determined that the requirements contain enough safeguards to allow for the placement of tailings and also provide an early warning system in the event of a leak in the liner system (EPA-HQ-OAR-2008-0218-0015). For this reason we are proposing to require as GACT that conventional impoundments, non-conventional impoundments and heap leach piles all comply with the liner requirements in 40 CFR 192.32(a)(1). Previously, Subpart W contained this requirement but included a more general reference to 40 CFR 192.32(a); we are proposing to replace that general reference with a more specific reference to 40 CFR 192.32(a)(1) to narrow the requirements under this proposed rule to only the design and construction requirements for the liner of the impoundment contained in 40 CFR 192.32(a)(1).

The estimated average cost of the liner requirement for each type of impoundment at uranium recovery facilities is listed in the table below (EPA-HQ-OAR-2008-0218-0087):

Table 2: Estimated Liner Costs

Table 2: Proposed GACT Standards Costs per Pound of U_3O_8			
	Unit Cost (\$/lb U_3O_8)		
	Conventional	ISL	Heap Leach
GACT – Double Liners for Nonconventional Impoundments	\$1.04	\$3.07	\$0.22
GACT – Maintaining 1 Meter of Water in Nonconventional Impoundments	\$0.013	\$0.010	\$0.0010
GACT – Liners for Heap Leach Piles	–	–	\$2.01
GACT – Maintaining Heap Leach Piles at 30% Moisture	–	–	\$0.0043
GACTs – Total for All Four	\$1.05	\$3.08	\$2.24

Table 2 presents a summary of the unit cost (per pound of U_3O_8) for implementing each GACT at each of the three types of uranium recovery facilities. In addition to presenting the GACT costs individually, Table 2 presents the total unit cost to implement all relevant GACTs at each type of facility.

Based on the Table 2, implementing all four GACTs would result in unit cost (per pound of U_3O_8) increases of about 2%, 6%, and 5% at conventional mills, ISL, and heap leach type uranium recovery facilities, respectively.

In making these cost estimates, we have assumed the following: (1) a conventional impoundment is no larger than 40 acres in size, which is the maximum size allowed for the

phased disposal option; (2) a nonconventional impoundment is no larger than 80 acres in size (the largest size we have seen); and (3) a heap leach pile is no larger than 40 acres in size (again, the maximum size allowed under the phased disposal work practice standard, although as with conventional impoundments the owner or operator is limited to two of these affected sources to be in operation at any time).

We do not have precise data for the costs associated with the liner requirements at conventional impoundments using the continuous disposal work practice standard because currently none exist, but a reasonable maximum approximation would be the costs for the 80 acre nonconventional impoundment, since it is the largest we have seen. We believe that no additional costs would be incurred for building a conventional impoundment that will use the continuous disposal option above what we estimated for building a nonconventional impoundment but we ask for comment on whether this assumption is reasonable. We also ask for data on the costs of building a conventional impoundment using continuous disposal, and how those costs would differ from the estimates provided above, or whether the costs we have listed for building a conventional impoundment using phased disposal are a reasonable

approximation of the costs for building a conventional impoundment using continuous disposal.

These liner systems are already required by 40 CFR 192.32(a)(1), which, as explained above, are requirements promulgated by EPA under UMTRCA that are incorporated into NRC regulations and implemented and enforced by NRC and NRC Agreement States through their licensing requirements. Therefore, we are not placing any additional liner requirements on facilities or requiring them to incur any additional costs to build their conventional or nonconventional impoundments or heap leach piles above and beyond what an owner or operator of these impoundments must already incur to obtain an NRC or NRC Agreement State license.

The liner systems we are proposing that heap leach piles must use are the same as those used for conventional and nonconventional impoundments. We estimate that the average costs associated with the construction of a 40 acre liner that complies with 40 CFR 192.32(a)(1)is approximately $15.3 million. When compared to the baseline capital costs associated with the facility (estimated at $356 million)(EPA-HQ-OAR-2008-0218-0087), the costs for constructing this type of liner system per facility is

about 4% of the total baseline capital costs of a heap leach pile facility (EPA-HQ-OAR-2008-0218-0087).[31]

2. Conventional Impoundments.

In the 1989 promulgation of Subpart W we required new conventional impoundments to comply with one of two work practice standards, phased disposal or continuous disposal. These work practice standards contain specific limits on the exposed area and/or number of operating conventional impoundments to limit radon emissions because we recognized that radon emissions from very large impoundments could impose unacceptable health effects if the piles were left dry and uncovered. We are proposing as the GACT standard that all conventional impoundments – both existing impoundments and new impoundments - comply with one of the two work practice standards, phased disposal or continuous

[31] For our purposes, baseline conditions are defined as a reference point that reflects the world without the proposed regulation. It is the starting point for conducting an economic analysis of the potential benefits and costs of a proposed regulation. The defined baseline influences first the level of emissions expected without regulatory intervention. It thereby also influences the projected level of emissions reduction that may be achieved as a consequence of the proposed regulation. Baselines have no standard definition besides the fact that they simply provide a reference scenario against which changes in economic and environmental conditions (in this case radon emissions) can be measured. In some instances, baselines have been established based on the assumption that economic, environmental and/or other conditions will continue on the present path or trend, purely as time dependant extensions of presently observed patterns. In other instances, baselines are derived from elaborate modeling projections. Because in all cases their purpose is to project a view of the world without the proposed regulatory intervention, baselines are sometimes termed "do nothing" or "business as usual" scenarios.

disposal, because these methods for limiting radon emissions by limiting the area of exposed tailings continue to be effective methods for reducing radon emissions from these impoundments (reference EPA 520-1-86-009, August 1986). We are proposing that existing impoundments also comply with one of the two work practice standards because, as discussed earlier, we no longer believe that a distinction needs to be made for conventional impoundments based on the date when they were designed and/or constructed.

We are also not aware of any conventional impoundments either in existence or planned that use any other technologies or management practices to reduce radon emissions. Operators continue to use the general management practices discussed above for reducing radon emissions from their conventional impoundments, i.e., limiting the size and/or number of the impoundments, and covering the tailings with soil or keeping the tailings wet. These management practices form the basis of the work practice standards for conventional impoundments and continue to be very effective methods for limiting the amount of radon released to the environment.

These work practice standards are a cost-effective method for reducing radon emissions from conventional

impoundments. In addition, the liner requirements for conventional impoundments are also required by the NRC in their licensing requirements at 10 CFR part 40. Therefore, we are proposing that GACT for conventional impoundments will be the same work practice standards as were previously included in Subpart W.

3. Non-conventional Impoundments where Tailings are Contained in Ponds and Covered by Liquids

Today we are proposing a GACT standard specifically for use by any operating uranium recovery facility that has one or more non-conventional impoundments at its facility (i.e., those impoundments where tailings are contained in ponds and covered by liquids). Common names for these structures may include, but are not limited to, impoundments, evaporation ponds and holding ponds. These ponds contain uranium byproduct material and the HAP emissions are regulated by Subpart W.

Industry has argued in preambles to responses to the CAA section 114(a) letters[32] and elsewhere that Subpart W does not, and was never meant to, include these types of evaporation or holding ponds under the Subpart W requirements. Industry has asserted that the original

[32] http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html.

Subpart W did not specifically reference evaporation or holding ponds but was regulating only conventional mill tailings impoundments. They argue that the ponds are temporary because they hold very little solid material but instead hold mostly liquids containing dissolved radionuclides (which emit very little radon), and at the end of the facility's life they are drained, and any solid materials, along with the liner system, are disposed in a properly licensed conventional impoundment.

EPA has consistently maintained that these non-conventional impoundments meet the existing applicability criteria for regulation under Subpart W. As defined at 40 CFR 61.251(g), uranium byproduct material or tailings means the waste produced by the extraction or concentration of uranium from any ore processed primarily for its source material content. The holding or evaporation ponds located at conventional mills, ISL facilities and potentially heap leach facilities contain uranium byproduct materials, either in solid form or dissolved in solution, and therefore their HAP emissions are regulated under Subpart W. Today we reiterate that position and are proposing a GACT standard more specifically tailored for these types of impoundments.

We are proposing that these non-conventional impoundments (the evaporation or holding ponds) must maintain a liquid level in the impoundment of no less than one meter at all times during the operation of the impoundment. Maintaining this liquid level will ensure that radon-222 emissions from the uranium byproduct material in the pond are minimized. We are also proposing that there is no maximum area requirement for the size of these ponds since the chance of radon emissions is small. Our basis for this determination is that radon emissions from the pond will be expected to be very low since the liquid in the ponds acts as an effective barrier to radon emissions; given that radon-222 has a very short half-life (3.8 days), there simply is not enough time for approximately 98% of the radon produced by the solids or from the solution to migrate to the water surface and cross the water/air interface before decaying.

By requiring a minimum of one meter of water in all nonconventional impoundments that contain uranium byproduct material, the release of radon from these impoundments would be greatly reduced. Nielson and Rogers (1986) present the following equation for calculating the radon attenuation:

$$A = e^{\left(-\left[\frac{\lambda}{D}\right]^{0.5} d\right)}$$

Where:			
	A	=	Radon attenuation factor (unit less)
	λ	=	Radon-222 decay constant (sec^{-1})
		=	2.1×10^{-6} sec^{-1}
	D	=	Radon diffusion coefficient (cm^2/sec)
		=	0.003 cm^2/sec in water
	d	=	Depth of water (cm)
		=	100 cm

The above equation indicates that the attenuation of radon emanation by water (i.e., the amount by which a water cover will decrease the amount of radon emitted from the impoundment) depends on how quickly radon-222 decays, how quickly radon-222 can move through water (the diffusion coefficient), and the thickness of the layer of water.[33] Solving the above equation shows that one meter of water has a radon attenuation factor of about 0.07. That is, emissions can be expected to be reduced by about 93% compared to no water cover.

The benefit incurred by this requirement is that significantly less radon will be released to the atmosphere. The amount varies from facility to facility based on the size of the nonconventional impoundment, but

[33] For a detailed discussion of this topic, which includes the effects of pond water mixing, wind and convection, please see "Risk Assessment Revision for 40 CFR Part 61 Subpart W-Radon Emissions from Operating Mill Tailings, Task 5 Radon Emission from Evaporation Ponds,"(EPA-HQ-OAR-2008-0218-0080).

across existing facilities radon can be expected to be reduced by approximately 24,600 curies, a decline of approximately 93%.

The estimated cost associated with complying with the proposed one meter of liquid that would be required to limit the amount of radon emissions to the air vary according to the size of the impoundment and the geographic area in which it is located. We estimate that this requirement will cost owners or operators of 80 acre nonconventional impoundments between $1,042 and $9,687 per year. This value varies according to the location of the impoundment, which will determine evaporation rates, which determines how much replacement water will be required to maintain the minimum amount of one meter. If the evaporated water is not replaced by naturally occurring precipitation, then it would need to be replaced with make-up water supplied by the nonconventional impoundment’s operator.

The most obvious source of water is what is known as “process water” from the extraction of uranium from the subsurface. Indeed, management of this process water is one of the primary reasons for constructing the impoundment in the first place, as the process water contains uranium byproduct material that must also be managed by the facility. It is possible that an operator could maintain

one meter of water in the impoundment solely through the use of process water. If so, this would not create any additional costs for the facility as the cost of the process water can be attributed to its use in the uranium extraction process. However, for purposes of estimating the economic impacts associated with our proposal, our cost estimate does not include process water as a source of water potentially added to the impoundment to replace water that has evaporated. Instead, we estimated the costs of using water from other sources. This method results in the most conservative cost estimate for compliance with the one meter requirement.

In performing the cost impacts for this requirement, three potential sources of impoundment make-up water were considered: (1) municipal water suppliers; (2) offsite non-drinking-water suppliers; and (3) on-site water (EPA-HQ-OAR-2008-0218-0087). Depending on the source of water chosen, we estimate that this requirement will cost owners or operators of nonconventional impoundments between $1,042.00 and $9,687.00 per year.[34]

[34] Municipal sources were the most expensive, with average unit costs of $0.0033 per gallon. Offsite non-drinking water sources were the cheapest, at $0.000069 per gallon on average. Various references were used for the comparisons. For more detail, please see Section 6.3.3 of the Background Information Document.

This value also varies according to the size and location of the nonconventional impoundment. Such impoundments currently range up to 80 acres in size. The requirement to maintain a minimum of one meter of liquid in the ponds is estimated to cost approximately $0.03 per pound of uranium produced. The annual cost of makeup water was divided by the base case facility yellowcake annual production rate to calculate the makeup water cost per pound of yellowcake produced (EPA-HQ-OAR-2008-0218-0087). We conclude that this proposed requirement is a cost-effective way to significantly reduce radon emissions from nonconventional impoundments, and is therefore appropriate to propose as a GACT standard for nonconventional impoundments.

4. Heap Leach Piles

The final affected source type for which we are proposing GACT standards is heap leach piles. While there are currently no operating uranium heap leach facilities in the United States, we are proposing to regulate the HAP emission at any future facilities using this type of uranium extraction under Subpart W since the moment that uranium extraction takes place in the heap, uranium byproduct materials are left behind. During the process of uranium extraction on a heap, as the acid drips through the

ore, uranium is solubilized and carried away to the collection system where it is further processed. At the point of uranium movement out of the heap, what remains is uranium byproduct materials as defined by 40 CFR 61.251(g). In other words, what remains in the heap is the waste produced by the extraction or concentration of uranium from ore processed primarily for its source material content. Thus, Subpart W applies because uranium byproduct materials are being generated during and following the processing of the uranium ore in the heap.

As a result, we are proposing GACT standards for heap leach piles. We are proposing that these piles conform to the phased disposal work practice standard specified for conventional impoundments in 40 CFR 61.252(a)(1)(i)(which limits the number of active heap leach piles to two, and limits the size of each one to no more than 40 acres) and that the moisture content of the uranium byproduct material in the heap leach pile be greater than or equal to 30% moisture content. We believe that the phased disposal approach can be usefully applied here because it limits the amount of tailings that can be exposed at any one time, which limits the amount of radon that can be emitted. The phased disposal work practice standard is applicable for heap leach piles because heap leach piles are expected to

be managed in a manner that is similar in many respects to conventional impoundments. Based on what we understand about the operation of potential future heap leach facilities, after the uranium has been removed from the heap leach pile, the uranium byproduct material that remains would be contained in the heap leach structure which would be lined according to the requirements of 40 CFR 192.32(a)(1). The heap leach pile would also be covered with soil at the end of its operational life to minimize radon emissions.

This is what is required to occur at conventional impoundments using the phased disposal standard. Limiting the size of the operating heap leach pile to 40 acres or less (and the number of operating heap leach piles at any one time to two) has the same effect as it does on conventional impoundments; that is, it limits the area of exposed uranium byproduct material and therefore limits the radon emissions from the heap leach pile. While we believe that the 40 acre limitation is appropriate for heap leach piles, we are requesting comment on what should be the maximum size (area) of a heap leach pile.

We are also proposing as GACT that the heap leach pile constantly maintain a moisture content of at least 30% by weight. By requiring a moisture content of at least 30%,

the byproduct material in the heap leach pile will not become dewatered, and we think that the heap leach pile will be sufficiently saturated with liquid to reduce the amount of radon that can escape from the heap leach pile. However, we request further information on all the chemical mechanisms in place during the leaching operation, and whether the 30% moisture content is sufficient for minimizing radon emissions from the heap leach pile. We also request comment on the amount of time the 30% moisture requirement should be maintained by a facility. We are proposing the term “operational life” of the facility. We are aware of several operations that take place during the uranium extraction process at a heap leach pile. After an initial period of several months of allowing lixiviant to leach uranium from the pile, the heap leach pile is allowed to “rest,” which enables the geochemistry in the pile to equilibrate. At that point the heap leach pile may be subjected to another round of extraction by lixiviant, or it may be rinsed to flush out any remaining uranium that is in solution in the heap leach pile. After the rinsing, the pile is allowed to drain and a radon barrier required by 40 CFR 192.32 can be emplaced. We are proposing that the operational life of the heap leach pile be from the time that lixiviant is first placed on the heap leach pile until

the time of the final rinse. We believe this incorporates a majority of the time when the heap leach pile is uncovered (no radon barrier has been constructed over the top of the heap) and when the ability for radon to be emitted is the greatest.

Because there is no "process water" component to a heap leach operation, as there is for an ISL, water for the heap leach pile must be supplied from an outside source. Even if an ISL and heap leach operation were to be located at the same site, we consider it unlikely that an operator would use ISL process water as the basis for an acidic heap leach solution. It is possible, in fact likely, that the solution used in the heap will be recycled (i.e., applied to the heap more than once), which could reduce the amount of outside water needed to some degree, although as we discuss later in this section, it would not seem that recycling solution would affect the overall moisture content. In calculating the high-end costs of heap leaching, we have not included this possibility in our estimates of economic impacts.

The unit costs for providing liquids to a heap leach pile are assumed to be the same as the unit costs developed for providing water to nonconventional impoundments. In estimating the cost impacts for this requirement, three

potential sources of impoundment make-up water were considered: (1) municipal water suppliers; (2) offsite non-drinking-water suppliers; and (3) on-site water. The only cost associated with maintaining the moisture level within the pile is the cost of the liquid. We assume that existing piping used to supply lixiviant to the pile during leaching would be used to supply water necessary for maintaining the moisture level. Also, we assume that the facility will use the in-soil method for moisture monitoring. The in-soil method and its costs are described below.

Soil moisture sensors have been used for laboratory and outdoor testing purposes and for agricultural applications for over 50 years. They are mostly used to measure moisture in gardens and lawns to determine when it is appropriate to turn on irrigation systems. Soil moisture sensors can either be placed in the soil or held by hand.

For example, one system would bury soil moisture sensors to the desired depth in the heap. Then, a portable soil moisture meter would be connected by cable to each buried sensor one at a time, i.e., a single meter can read any number of sensors. The portable soil moisture meter costs about $350, and each in-soil sensor about $35 or $45, depending on the length of the cable (either 5 or 10 ft). Finally, it is assumed that moisture readings would be

performed during the NRC required daily inspections of the heap leach pile, which would require approximately 2,000 additional work hours per year per facility. Our estimates for costs of monitoring the heap include 100 sensors located within the heap, with a meter on each sensor. We chose 100 sampling stations because heaps are generally the same size as conventional impoundments, and Method 115 prescribed 100 measurements for the tailings area of a conventional impoundment. The total estimated costs for using this system, including labor, are approximately $86,500 per year per facility.

Alternatively, with a handheld soil moisture meter, two rods (up to 8 inches long) that are attached to the meter are driven into the soil at the desired location, and a reading is taken. A handheld meter of this type costs about $1,065, and replacement rods about $58 for a pair. A minimum of 100 sampling stations for measuring radon could be required. We did not estimate costs for this method, as we concluded that the length of time required walking around a heap leach pile and obtaining these measurements required more time than is found in an average work day, and would expose workers to potentially hazardous constituents contained in the lixiviant.

The base case heap leach facility includes a heap leach pile that will occupy up to 80 acres at a height of up to 50 feet. With an assumed porosity of 0.39 and a moisture content of 30% by weight, the effective surface area of the liquid within the heap pile is 33.7 acres.

Table 3 presents the calculated cost for make-up water to maintain the moisture level in the heap leach pile, such that the moisture content is at 30% by weight, or greater. The unit costs for water and the net evaporation rates used for these estimates are identical to those derived for evaporation ponds.

Table 3: Heap Leach Pile Annual Makeup Water Cost

Cost Type	Water Cost ($/gal)	Net Evaporation (in/yr)	Makeup Water Cost ($/yr)	Makeup Water Rate (gpm/ft^2)
Mean	$0.00010	45.7	$4,331	2.3E-05
Median	$0.00010	41.3	$3,946	2.1E-05
Minimum	$0.000035	6.1	$196	3.0E-06
Maximum	$0.00015	96.5	$13,318	4.8E-05

To place this amount of make-up water in perspective, during leaching and rinsing of the heap leach pile, liquid is dripped onto the pile at a rate of 0.005 gallons per minute per square foot (gpm/ft^2). This rate is significantly higher than the make-up water rates necessary to maintain the moisture content at 30% by weight, shown in Table 3. We conclude from this analysis that the leaching solution

applied in a typical operation should be sufficient to maintain the moisture content of the heap leach pile to the required levels, and only in unusual circumstances (such as during the final rinse and draindown of the heap leach pile) would additional liquids need to be applied. However, in a circumstance that would require the additional application of liquid to maintain the 30% moisture limit, such as excessive evaporation, we estimate that the cost of requiring the owner/operator of a heap leach pile to maintain 30% moisture content in the pile will average approximately $4,000 per year.

We are asking for comment on exactly where in the pile the 30% moisture content should be achieved. We are also soliciting comments on whether the leaching operation itself liberates more radon into the air than the equivalent of a conventional impoundment. We assume that because low-grade ore is usually processed by heap leach, there would be less radon emitted from a heap leach pile than from a conventional impoundment of similar size. We request information on whether this is a correct assumption.

We are also aware that there could be a competing argument against regulating the heap leach pile under Subpart W while the lixiviant is being placed on the heap

leach pile. While not directly correlative, the process of heap leach could be defined as active "milling." The procedure being carried out on the heap is the extraction of uranium. In this view, the operation is focused on the production of uranium rather than on managing uranium byproduct materials. Therefore, under this view, the heap meets the definition of tailings under 40 CFR 61.251(g) only after the final rinse of the heap solutions occurs and the heap is preparing to close. In this scenario the heap leach pile would close under the requirements at 40 CFR part 192.32 and Subpart W would never apply. We are requesting comments on the relative merits of this interpretation.

It bears noting that, as with ISL facilities, collection and/or evaporation ponds (nonconventional impoundments) may exist at heap leach facilities that will also contain uranium byproduct materials. These ponds' HAP emissions will be regulated under Subpart W regardless of whether the heap leach pile is also subject to regulation under that subpart.

V. Other Issues Generated by Our Review of Subpart W

During our review of Subpart W we also identified several issues that need clarification in order to be more fully understood. The issues that we have identified are:

- Clarification of the term “standby” and how it relates to the operational phase of an impoundment;
- Amending the definition of “operation” of an impoundment so that it is clear when the owner or operator is subject to the requirements of Subpart W;
- Determining whether Subpart W adequately addresses protection from extreme weather events;
- Revising 40 CFR 61.252(b) and (c) to accurately reflect that it is only 40 CFR 192.32(a)(1)that is applicable to Subpart W; and
- Removing the phrase “as determined by the Nuclear Regulatory Commission” in 40 CFR 61.252(b)(1) and (2).

A. Clarification of the Term “Standby”

There has been some confusion over whether the requirements of Subpart W apply to an impoundment that is in “standby” mode. This is the period of time that an impoundment may not be accepting tailings, but has not yet entered the “closure period” as defined by 40 CFR 192.31(h). This period of time usually takes place when the price of uranium is such that it may not be cost effective for the uranium recovery facility to continue operations, and yet the facility has not surrendered its operating license, and may re-establish operations once the price of

uranium rises to a point where it is cost effective to do so. Since the impoundment has not entered the closure period, it could continue to accept tailings at any time; therefore, Subpart W requirements continue to apply to the impoundment.

Today we are proposing to add a definition to 40 CFR 61.251 to define "standby" as:

> Standby means the period of time that an impoundment may not be accepting uranium byproduct materials but has not yet entered the closure period.

B. Amending the definition of "Operation" for a conventional impoundment

As currently written, 40 CFR 61.251(e) defines the operational period of a tailings impoundment. It states that "operation" means that an impoundment is being used for the continuing placement of new tailings or is in standby status for such placement (which means that as long as the facility has generated byproduct material at some point and placed it in an impoundment, it is subject to the requirements of Subpart W). An impoundment is in operation from the day that tailings are first placed in the impoundment until the day that final closure begins.

There has been some confusion over this definition. For example, a uranium mill announced that it was closing a

pre-December 15, 1989, impoundment. Before initiating closure, however, it stated that it would keep the impoundment open to dispose of material generated by other closure activities at the site that contained byproduct material (liners, deconstruction material, etc) but not "new tailings." The company argued that since it was not disposing of new tailings the impoundment was no longer subject to Subpart W. We disagree with this interpretation. While it may be true that the company was no longer disposing of new tailings in the impoundment, it has not begun closure activities; therefore, the impoundment is still open to disposal of byproduct material that emits radon and continues to be subject to all applicable Subpart W requirements.

To prevent future confusion, we are proposing today to amend the definition of "operation" in the Subpart W definitions at 40 CFR 61.251 as follows:

Operation means that an impoundment is being used for the continued placement of uranium byproduct material or tailings or is in standby status for such placement. An impoundment is in operation from the day that uranium byproduct materials or tailings are first placed in the impoundment until the day that final closure begins.

C. Weather Events

In the past, uranium recovery facilities have been located in the western regions of the United States. In

these areas, the annual precipitation falling on the impoundment, and any drainage area contributing surface runoff to the impoundment, has usually been less than the annual evaporation from the impoundment. Also, these facilities have been located away from regions of the country where extreme rainfall events (e.g., hurricanes or flooding) could jeopardize the structural integrity of the impoundment, although there is a potential for these facilities to be affected by flash floods, tornadoes, etc. Now, however, uranium exploration and recovery in the U.S. has the potential to move eastward, into more climatologically temperate regions of the country, with south central Virginia being considered for a conventional uranium mill. In determining whether additional measures would be needed for impoundments operating in areas where precipitation exceeds evaporation, a review of the existing requirements was necessary.

The proposed revisions to Subpart W will continue to require owners and operators of all impoundments to follow the requirements of 40 CFR 192.32(a)(1). That particular regulation references the RCRA surface impoundment design and operations requirements of 40 CFR 264.221. At 40 CFR 264.221(g) and (h) are requirements that ensure proper design and operation of tailings impoundments. Section

264.221(g) states that impoundments must be designed, constructed, maintained and operated to prevent overtopping resulting from normal or abnormal operations; overfilling; wind and rain action (e.g., a two foot freeboard requirement); rainfall; run-on; malfunctions of level controllers, alarms and other equipment; and human error. Section 264.221(h) states that impoundments must have dikes that are designed, constructed and maintained with sufficient structural integrity to prevent massive failure of the dikes. In ensuring structural integrity, it must not be presumed that the liner system will function without leakage during the active life of the unit.

Since impoundments at uranium recovery facilities have been and will continue to be required to comply with the requirements of 40 CFR 192.32(a)(1), they are already required to be designed to prevent failure during extreme weather events. As we stated in Section IV B.2., we believe the requirements of 40 CFR 192.32(a)(1) contain enough safeguards to allow for the placement of tailings and yet provide an early warning system in the event of a leak in the liner system. Therefore, we are proposing to include these requirements in the Subpart W requirements without modification.

D. Applicability of 40 CFR 192.32(a) to Subpart W

The requirements at 40 CFR 61.252(b) and (c) require compliance with 40 CFR 192.32(a). However, we are now proposing to focus the Subpart W requirements on the impoundment design and construction requirements found specifically at 40 CFR 192.32(a)(1). The remainder of 40 CFR 192.32(a) goes beyond this limited scope by including requirements for ground-water detection monitoring systems and closure of operating impoundments. These other requirements, along with all of the part 192 standards, are implemented and enforced by the NRC through its licensing requirements for uranium recovery facilities at 10 CFR part 40, Appendix A. However, when referenced in Subpart W, the requirements in 40 CFR 192.32(a)(1) would also be implemented and enforced by EPA as the regulatory authority administering Subpart W under its CAA authority. Therefore today we are proposing to revise 40 CFR 61.252 (b) and (c) to specifically define which portions of 40 CFR 192.32(a) are applicable to Subpart W. At the same time we are proposing to eliminate the phrase "…as determined by the Nuclear Regulatory Commission" from 40 CFR 61.252(b). This should eliminate confusion regarding what an applicant must submit to EPA under the CAA in its pre-construction and modification approval applications as required by 40 CFR 61.07, and better explain that EPA is the regulatory agency

administering Subpart W under the CAA. This proposed change will have no effect on the licensing requirements of the NRC or its regulatory authority under UMTRCA to implement the part 192 standards through its licenses.

VI. Summary of Environmental, Cost and Economic Impacts

As discussed earlier, uranium recovery activities are carried out at several different types of facilities. We are proposing to revise Subpart W based on how uranium recovery facilities manage uranium byproduct materials during and after the processing of uranium ore at their particular facility. As discussed in Sections III and IV, we are proposing GACT requirements for three types of affected sources at uranium recovery facilities: (1) conventional impoundments; (2) nonconventional impoundments; and (3) heap leach piles.

For purposes of analyzing the impacts of the proposed rule, we assumed that approximately five conventional milling facilities, 50 ISL facilities (although this is only a projection since only 12 currently exist) and one heap leach facility, each with at least one regulated impoundment, would become subject to the proposed rule. The following sections present our estimates of the proposed rule's air quality, cost and economic impacts. For more information, please refer to the Economic Impact Analysis

report that is included in the public docket for this proposed rule (EPA-HQ-OAR-2008-0218-0087).

A. What are the air quality impacts?

We project that the proposed requirements will maintain or improve air quality surrounding the regulated facilities. The GACT standards being proposed today are based on control technologies and management practices that have been used at uranium recovery facilities for the past twenty or more years. These standards will minimize the amount of radon that is released to the air by keeping the impoundments wet or covered with soil and/or by limiting the area of exposed tailings. The requirements in this proposed rule should eliminate or reduce radon emissions at all three types of affected sources.

B. What are the cost and economic impacts?

Table 24 presents a summary of the unit cost (per pound of U_3O_8) for implementing each GACT at each of the three types of uranium recovery facilities. In addition to presenting the GACT costs individually, Table 24 presents the total unit cost to implement all relevant GACTs at each type of facility.

A reference facility for each type of uranium recovery facility is developed and described in Section 6.2, including the base cost estimate to construct and operate

(without the GACTs) each of the three types of reference facilities. For comparison purposes, the unit cost (per pound of U_3O_8) of the three uranium recovery reference facilities is presented at the bottom of Table 4.

Table 4: Proposed GACT Standards Costs per Pound of U_3O_8			
	Unit Cost ($/lb U_3O_8)		
	Conventional	ISL	Heap Leach
GACT – Double Liners for Nonconventional Impoundments	$1.04	$3.07	$0.22
GACT – Maintaining 1 Meter of Water in Nonconventional Impoundments	$0.013	$0.010	$0.0010
GACT – Liners for Heap Leach Piles	–	–	$2.01
GACT – Maintaining Heap Leach Piles at 30% Moisture	–	–	$0.0043
GACTs – Total for All Four	$1.05	$3.08	$2.24
Baseline Facility Costs (Section 6.2)	$51.56	$52.49	$46.08

Based on the information in Table 24, implementing all four GACTs would result in unit cost (per pound of U_3O_8) increases of about 2%, 6%, and 5% at conventional, ISL, and heap leach type uranium recovery facilities, respectively.

The baseline costs were estimated using recently published cost data for actual uranium recovery facilities. For the model conventional mill, we used data from the recently licensed new mill at the Piñon Ridge project in Colorado. For the model ISL facility, we used data from two

proposed new facilities: (1) the Centennial Uranium project in Colorado; and (2) the Dewey-Burdock project in South Dakota. The Centennial project is expected to have a 14- to 15-year production period, which is a long duration for an ISL facility, while the Dewey-Burdock project is expected to have a shorter production period of about 9 years, which is more representative of ISL facilities. For the heap leach facility, we used data from the proposed Sheep Mountain project in Wyoming.

Existing Subpart W required facilities to perform annual monitoring using Method 115 to demonstrate that the radon flux standard at conventional impoundments constructed before December 15, 1989 was below 20 pCi/m^2-sec. The proposed removal of this monitoring requirement would result in a cost saving to the three facilities for which this requirement still applies: (1) Sweetwater; (2) White Mesa; and (3) Shootaring Canyon. Method 115 requires 100 measurements as the minimum number of flux measurements considered necessary to determine a representative mean radon flux value. For the three sites that are still required to perform Method 115 radon flux monitoring, the average annual cost to perform that monitoring is estimated to be about $9,730 for Shootaring and Sweetwater, and $19,460 for White Mesa. For all three sites the total

annual average cost is estimated to be $38,920 per year, with a range from approximately $28,000 to $49,500 per year. For all three sites the total annual average cost savings resulting from removal of the flux monitoring requirement would be $39,920.

Baseline costs (explained in Section IV.B) for conventional impoundment liner construction[35] will remain the same, since the proposed rule does not impose additional requirements. Liners meeting the requirements at 40 CFR 192.32(a)(1) are already mandated by other regulations and, therefore, built into the baseline cost estimate. Therefore there are consequently no costs (or benefits) resulting from the inclusion of these requirements in Subpart W.

The average cost to construct one of these impoundments is $13.8 million. We estimate that this cost

[35] These liner systems (conventional, nonconventional and heap leach piles)are already required by 40 CFR 192.32(a)(1), which, as explained above, are requirements promulgated by EPA under UMTRCA that are incorporated into NRC regulations and implemented and enforced by NRC through their licensing requirements. Therefore, we are not placing any additional liner requirements on facilities or requiring them to incur any additional costs to build their conventional or nonconventional impoundments or heap leach piles above and beyond what an owner or operator of these impoundments must already incur to obtain an NRC license. Therefore, there are no projected costs (or benefits) beyond the baseline resulting from the inclusion of these requirements in Subpart W.

is approximately 3% of the total baseline capital costs to construct a conventional mill, estimated at $372 million.

We have estimated that for an average 80 acre nonconventional impoundment the average cost of construction of an impoundment is $23.7 million. Requiring impoundments to comply with the liner requirements in 40 CFR 192.32(a)(1) will contain the uranium byproduct material and reduce the potential for ground water contamination. The only economic impact attributable to the proposed rule is the cost of complying with the new requirement to maintain a minimum of one meter of water in the nonconventional impoundments during operation and standby. As shown in Section IV.B.3. of this preamble, as long as approximately one meter of water is maintained in the nonconventional impoundments the effective radon emissions from the ponds are so low that it is difficult to determine if there is any contribution above background radon values. In order to maintain one meter of liquid within a pond, it is necessary to replace the water that is evaporated from the pond. Depending on the source of water chosen,[36] we estimate that this requirement will cost owners

[36] Municipal sources were the most expensive, with average unit costs of $0.0033 per gallon. Offsite non-drinking water sources were the cheapest, at $0.000069 per gallon on average. For more detail, please see Section 6.3.3 of the Background Information Document.

or operators of nonconventional impoundments between $1,042 and $9,687 per year. This value also varies according to the size of the nonconventional impoundment, up to 80 acres, and the location of the impoundment. Evaporation rates vary by geographic location. However, the cost to maintain the one meter of liquid in a nonconventional impoundment is estimated to be less than 1% of the total annual production costs, estimated at $23.7 million. The requirement to maintain a minimum of one meter of liquid in the ponds is estimated to cost approximately $0.03 per pound of uranium produced.

Designing and constructing heap leach piles to meet the requirements at 40 CFR 192.32(a)(1) would minimize the potential for leakage of uranium enriched lixiviant into the ground water. Specifically, this would require that a double liner, with drainage collection capabilities, be provided under heap leach piles. Baseline costs (explained in Section IV.B) for heap leach pile liner construction will remain the same, since the proposed rule does not impose additional requirements. Liners meeting the requirements at 40 CFR 192.32(a)(1) are already mandated by other regulations and, therefore, built into the baseline cost estimate. Therefore there are consequently no costs (or benefits) resulting from the inclusion of these

requirements in Subpart W. Baseline costs for construction will be essentially the same as for conventional impoundments. Since the liner systems are equivalent to the systems used for conventional and nonconventional impoundments, we have been able to estimate the average costs associated with the construction of heap leach pile impoundments that meet the liner requirements we are proposing, and compare them to the costs associated with the total production of uranium produced by the facility. The average cost of constructing such an impoundment is estimated to be approximately $15.3 million. The costs of constructing this type of liner system are about 4% of the estimated total baseline capital costs of a heap leach facility estimated at $356 million.

For heap leach piles, when the soil moisture content in the heap leach pile falls below about 30% by weight, the radon flux out of the heap leach pile increases because radon moves through the air faster (with less opportunity to decay) than through water. We concluded from our analysis that the leaching solution applied in a typical operation should be sufficient to maintain the moisture content of the heap leach pile to the required levels, and only in unusual circumstances would additional liquids need to be applied. However, in a circumstance that would

require the additional application of liquid to maintain the 30% moisture limit, such as excessive evaporation, we estimate that the cost of requiring the owner/operator of a heap leach pile to maintain 30% moisture content in the pile will average approximately $4,000 per year. We also estimate that it will cost approximately $86,500 per year (which includes labor of approximately 2,000 hours) to perform the tests required to verify that the moisture content is being maintained. These costs are less than one percent of the total baseline capital costs of a heap leach facility, estimated at $356 million.

In summary, we estimate that for conventional impoundments there will be no additional costs incurred through this proposed rule. There will be a cost savings of approximately $39,900 per year for the three existing conventional impoundments that are currently required to monitor for radon flux through the use of Method 115, since we are proposing to eliminate this requirement. For nonconventional impoundments we estimate that the additional costs incurred by this proposed rule will be to maintain one meter of liquid in each nonconventional impoundment, and we have estimated those costs between approximately $1,040 and $9,680 per year. For heap leach piles, additional costs incurred by this proposed rule

would be for the maintaining and monitoring of the continuous 30% moisture content requirement, which we estimate will impose a one-time cost of approximately $35,000 for equipment and approximately $86,000 per year to monitor the moisture content.

C. What are the non-air environmental impacts?

Water quality would be maintained by implementation of this proposed rule. This proposed rule does contain requirements (by reference) related to water discharges and spill containment. In fact, the liner requirements cross referenced at 40 CFR 192.32(a)(1) will significantly decrease the possibility of contaminated liquids leaking from impoundments into ground water (which can be a significant source of drinking water). Section 192.32(a)(1) includes a cross-reference to the surface impoundment design and construction requirements of hazardous waste surface impoundments regulated under the Resource Conservation and Recovery Act (RCRA), found at 40 CFR 264.221. Those requirements state that the impoundment shall be designed, constructed and installed to prevent any migration of wastes out of the impoundment to the adjacent subsurface soil or ground water or surface water at any time during the active life of the impoundment. There are other requirements for the design and operation of the

impoundment, and these include construction specifications, slope requirements, sump and liquid removal requirements.

These liner systems (conventional, nonconventional and heap leach piles)are already required by 40 CFR 192.32(a)(1), which, as explained above, are requirements promulgated by EPA under UMTRCA that are incorporated into NRC regulations and implemented and enforced by NRC through their licensing requirements. Therefore, we are not placing any additional liner requirements on facilities or requiring them to incur any additional costs to build their conventional or nonconventional impoundments or heap leach piles above and beyond what an owner or operator of these impoundments must already incur to obtain an NRC license.

Including a double liner in the design of all onsite impoundments that would contain uranium byproduct material would reduce the potential for ground-water contamination. Although the amount of the potential reduction is not quantifiable, it is important to take this into consideration due to the significant use of ground water as a source of drinking water.

VII. Statutory and Executive Orders Review

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), this action is a "significant regulatory action." The Executive Order defines "significant regulatory action" as one that is likely to result in a rule that may "raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order." Accordingly, EPA submitted this action to the Office of Management and Budget (OMB) for review under Executive Orders 12866 and 13563 (76 FR 3821, January 21, 2011) and any changes made in response to OMB recommendations have been documented in the docket for this action.

B. Paperwork Reduction Act

The information collection requirements in this proposed rule have been submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act, 44 U.S.C. 3501 et seq. The Information Collection Request (ICR) document prepared by EPA has been assigned EPA ICR number 2464.01.

The information to be collected for the proposed rulemaking today is based on the requirements of the Clean Air Act. Section 114 authorizes the Administrator of EPA to require any person who owns or operates any emission source or who is subject to any requirements of the Act to:

- Establish and maintain records
- Make reports, install, use, and maintain monitoring equipment or method
- Sample emissions in accordance with EPA-prescribed locations, intervals and methods
- Provide information as may be requested

EPA's regional offices use the information collected to ensure that public health continues to be protected from the hazards of radionuclides by compliance with health based standards and/or Generally Available Control Technology (GACT).

The proposed rule would require the owner or operator of a uranium recovery facility to maintain records that confirm that the conventional impoundment(s), nonconventional impoundment(s) and heap leach pile(s) meet the requirements in section 192.32(a)(1). Included in these records are the results of liner compatibility tests, measurements confirming that one meter of liquid has been maintained in nonconventional impoundments and records confirming that heap leach piles have constantly maintained at least 30% moisture content during the operating life of the heap leach pile. This documentation should be sufficient to allow an independent auditor (such as an EPA inspector) to verify the accuracy of the determination made

concerning the facility's compliance with the standard. These records must be kept at the mill or facility for the operational life of the facility and, upon request, be made available for inspection by the Administrator, or his/her authorized representative. The proposed rule would not require the owners or operators of operating impoundments and heap leach piles to report the results of the compliance inspections or calculations required in Section 61.255. The recordkeeping requirements require only the specific information needed to determine compliance. We have taken this step to minimize the reporting requirements for small business facilities.

The annual proposed monitoring and recordkeeping burden to affected sources for this collection (averaged over the first three years after the effective date of the proposed rule) is estimated to be 10,400 hours with a total annual cost of $400,000. This estimate includes a total capital and start-up cost component annualized over the facility's expected useful life, a total operation and maintenance component, and a purchase of services component. We estimate that this total burden will be spread over 21 facilities that will be required to keep records. Of this total burden, however, 4,150 hours (and $93,000) will be incurred by the one heap leach uranium

recovery facility, due to the requirements for purchasing, installing and monitoring the soil moisture sensors, as well as training staff on how to operate the equipment.

Burden is defined at 5 CFR 1320.3(b). An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

To comment on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, EPA has established a public docket for this rule, which includes this ICR, under Docket ID number EPA-HQ-OAR-2008-0218. Submit any comments related to the ICR to EPA and OMB. See ADDRESSES section at the beginning of this notice for where to submit comments to EPA. Send comments on the ICR to OMB to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW, Washington, DC 20503, Attention: Desk Office for EPA. Since OMB is required to make a decision concerning the ICR between 30 and 60 days after **[Insert date of publication in the Federal Register.]**, a comment to OMB is best assured of having its full effect if OMB receives it by **[Insert date**

30 days after publication in the Federal Register.]. The final rule will respond to any OMB or public comments on the information collection requirements contained in this proposal.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of today's rule on small entities, small entity is defined as: (1) a small business whose company has less than 500 employees and is primarily engaged in leaching or beneficiation of uranium, radium or vanadium ores as defined by NAIC code 212291; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is

independently owned and operated and is not dominant in its field.

After considering the economic impacts of this proposed rule on small entities, I certify that this action will not have a significant economic impact on a substantial number of small entities. This proposed rule is estimated to impact approximately 18 uranium recovery facilities that are currently operating or plan to operate in the future.

To evaluate the significance of the economic impacts of the proposed revisions to Subpart W, separate analyses were performed for each of the three proposed GACTs.

The GACT for uranium recovery facilities that use conventional milling techniques proposes that only phased disposal units or continuous disposal units be used to manage the tailings. For either option, the disposal unit must be lined and equipped with a leak detection system, designed in accordance with part 192.32(a)(1). If phased disposal is the option chosen, the rule limits the disposal unit to a maximum of 40 acres, with no more than two units open at any given time. If continuous disposal is chosen, no more than 10 acres may be open at any given time. Finally, the Agency is proposing to eliminate the distinction that was made in the 1989 rule between

impoundments constructed pre-1989 and post-1989 since all of the remaining pre-1989 impoundments comply with the proposed GACT. The elimination of this distinction also eliminates the requirement that pre-1989 disposal units be monitored on an annual basis to demonstrate that the average Rn-222 flux does not exceed 20 pCi/m^2/sec.

The conventional milling GACT applies to three existing mills and one proposed mill that is in the process of being licensed. The four conventional mills are: the White Mesa mill owned by Energy Fuels Resources (USA); the Shootaring Canyon mill owned by Uranium One, Inc.; the Sweetwater mill owned by Kennecott Uranium Co.; and the proposed Piñon Ridge mill owned by Energy Fuels, Inc. Of the three companies that own conventional mills, none are classified as small businesses using fewer than 500 employees as the classification criterion.

Energy Fuels White Mesa mill uses a phased disposal system that complies with the proposed GACT. When its existing open unit is full it will be contoured and covered and a new unit, constructed in accordance with the proposed GACT, will be opened to accept future tailings. Energy Fuels is proposing a phased disposal system to manage its tailings; this system also complies with the proposed GACT.

Based on the fact that both small entities are in compliance with the proposed GACT, we conclude that the rulemaking will not impose any new economic impacts on either facility. For Energy Fuels Mines, the proposed rule will actually result in a cost saving as it will no longer have to perform annual monitoring to determine the average radon flux from its impoundments.

The GACT for evaporation ponds at uranium recovery facilities requires that the evaporation ponds be constructed in accordance with design requirements in part 192.32(a)(1) and that a minimum of 1 meter of liquid be maintained in the ponds during operation and standby. The key design requirements for the ponds are for a double-liner with a leak detection system between the two liners.

In addition to the four conventional mills identified above, the GACT for evaporation ponds applies to in-situ leach facilities and heap leach facilities. Currently, there are five operating ISL facilities and no operating heap leach facilities. The operating ISLs are Crow Butte and Smith Ranch owned by Cameco Resources, Alta Mesa owned by Mestena Uranium, LLC, Willow Creek owned by Uranium One, Inc., and Hobson owned by Uranium Energy Corp. Again using the fewer than 500 employees’ criterion, Mestena Uranium, LLC and Uranium Energy Corp are both small businesses,

while Cameco Resources and Uranium One, Inc. are both large businesses.

All of the evaporation ponds at the four conventional mills and the five ISL facilities were built in conformance with part 192.32(a)(1). Therefore, the only economic impact is the cost of complying with the new requirement to maintain a minimum of 1 meter of water in the ponds during operation and standby.

The proposed revisions to Subpart W apply to five currently operating ISL facilities. The operating facilities are Crow Butte (Nebraska) and Smith Ranch (Wyoming), owned by Cameco Resources; Alta Mesa (Texas), owned by Mestena Uranium, LLC; Willow Creek (Wyoming), owned by Uranium One, Inc.; and Hobson (Texas), owned by Uranium Energy Corp. Again using the fewer than 500 employees' criterion, Mestena Uranium, LLC and Uranium Energy Corp are both small businesses, while Cameco Resources and Uranium One, Inc. are both large businesses.

In addition to the five operating ISL facilities, three additional ISL facilities have been licensed, all in the state of Wyoming. These are: Lost Creek, owned by Ur-Energy Inc.; Moore Ranch, owned by Uranium One, Inc.; and Nichols Ranch, owned by Uranerz Uranium Corp. Of these

three companies, both Ur-Energy Inc. and Uranerz Uranium Corp. are small businesses.

Eleven other ISL facilities have been proposed for licensing. These include: Dewey-Burdock (South Dakota) and Centennial (Colorado), both owned by Powertech Uranium Corp.; and Kingsville Dome, Los Finados, Rosito, and Vasques (Texas), all owned by Uranium Resources Inc.; Crownpoint (New Mexico), also owned by Uranium Resources Inc., Church Rock (New Mexico), owned by Strathmore Minerals; Ross (Wyoming), owned by Strata Energy, Inc., Goliad (Texas), owned by Uranium Energy Corp.; and Antelope-Jab (Wyoming), owned by Uranium One, Inc. All of these companies, except for Uranium One, Inc. are small businesses.

According to the licensing documents submitted by the owners of the proposed ISL facilities, all will be constructed in conformance with part 192.32(a)(1). Therefore the only economic impact is the cost of complying with the new requirement to maintain a minimum of 1 meter of water in the ponds during operation and standby.

The requirement to maintain a minimum of 1 meter of liquid in the ponds is estimated to cost up to $0.03 per pound of U_3O_8 produced. This cost is not a significant impact on any of these small entities.

Although there are no heap leach facilities currently licensed, Energy Fuels, Inc. is expected to submit a licensing application for the Sheep Mountain Project. From the preliminary documentation that Titan presented (now owned by Energy Fuels), the facility will have an Evaporation Pond, a Collection Pond, and a Raffinate Pond. All three ponds will be double lined with leak detection. However, as Energy Fuels is a large business, it does not affect the determination of impacts on small businesses.

The GACT for heap leach facilities applies the phased disposal option of the GACT for conventional mills to these facilities and adds the requirement that the heap leach pile be maintained at a minimum 30 percent moisture content by weight during operations.

As noted previously, there are no heap leach facilities currently in existence, and the only one that is known to be preparing to submit a license application is being proposed by Energy Fuels, which is a large business.

Of the 20 facilities identified above, 15 are owned by small businesses. No small organizations or small governmental entities have been identified that would be impacted by the proposed GACTs. We continue to be interested in the potential impacts of the proposed rule on

small entities and welcome comments on issues related to such impacts.

D. Unfunded Mandates Reform Act

This rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local and tribal governments, in the aggregate, or the private sector in any one year. The proposed rule imposes no enforceable duties on any State, local or Tribal governments or the private sector. Thus, this rule is not subject to the requirements of sections 202 or 205 of UMRA.

This rule is also not subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments because it contains no requirements that apply to such governments nor does it impose obligations upon them.

E. Executive Order 13132: Federalism

This proposed rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the facilities subject to this action are owned and

operated by State governments, and, nothing in the proposed rule will supersede State regulations. Thus, Executive Order 13132 does not apply to this proposed rule.

In the spirit of Executive Order 13132 and consistent with EPA policy to promote communications between EPA and State and local governments, EPA specifically solicits comment on this proposed rule from State and local officials.

F. Executive Order 13175: Consultation and Coordination with Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). The action imposes requirements on owners and operators of specified area sources and not tribal governments. Thus, Executive Order 13175 does not apply to this action.

EPA specifically solicits additional comment on this proposed action from tribal officials.

G. Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks

EPA interprets EO 13045 (62 FR 19885, April 23, 1997) as applying to those regulatory actions that concern health or safety risks, such that the analysis required under section 5-501 of the Order has the

potential to influence the regulation. This action is not subject to EO 13045 because it is based solely on technology performance.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not a "significant energy action" as defined in Executive Order 13211 (66 FR 28355 (May 22, 2001)), because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. This proposed rule will not adversely directly affect productivity, competition, or prices in the energy sector.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 ("NTTAA"), Public Law No. 104-113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. NTTAA directs EPA to provide Congress, through OMB,

explanations when the Agency decides not to use available and applicable voluntary consensus standards.

This proposed rulemaking does not involve technical standards. Therefore, EPA is not considering the use of any voluntary consensus standards.

We request public comment on this aspect of the proposed rulemaking, and specifically, ask you to identify potentially applicable voluntary consensus standards and to explain why such standards could be used in this regulation.

J. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898 (59 FR 7629 (Feb. 16, 1994)) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

EPA has determined that this proposed rule will not have disproportionately high and adverse human health or environmental effects on minority or low-income populations because it increases the level of environmental protection for all affected populations without having any disproportionately high and adverse human health or environmental effects on any population, including any minority or low-income population. This proposed rule would reduce toxics emissions of radon from nonconventional impoundments and heap leach piles and thus decrease the amount of such emissions to which all affected populations are exposed.

List of Subjects in 40 CFR Part 61

Environmental protection, Air pollution control, Hazardous substances, Radon, Tailings, Byproduct, Uranium, Reporting and recordkeeping requirements.

____
Dated:

____
Gina McCarthy,
Administrator.

For the reasons stated in the preamble, the Environmental Protection Agency proposes to amend title 40, Chapter I of the Code of Federal Regulations as follows:

PART 61—-[National Emission Standards for Hazardous Air Pollutants]

1. The authority citation for part 61 continues to read as follows:

Authority: 42 U.S.C. 7401 et seq.

Subpart W—[National Emission Standards for Radon Emissions From Operating Mill Tailings]

2. Section 61.251 is amended by revising definition e and adding new definitions h-m as follows:

§61.251 Definitions

*   *   *   *   *

(e) Operation. Operation means that an impoundment is being used for the continued placement of uranium byproduct materials or tailings or is in standby status for such placement. An impoundment is in operation from the day that uranium byproduct materials or tailings are first placed in the impoundment until the day that final closure begins.

(h) Conventional Impoundment. A conventional impoundment is a permanent structure located at any uranium recovery facility which contains mostly solid uranium byproduct material from the extraction of uranium from uranium ore. These impoundments are left in place at facility closure.

(i) Non-Conventional Impoundment. A non-conventional impoundment can be located at any uranium recovery facility and contains uranium byproduct material suspended in and/or covered by liquids. These structures are commonly known as holding ponds or evaporation ponds. They are removed at facility closure.

(j) Heap Leach Pile. A heap leach pile is a pile of uranium ore placed on an engineered structure and stacked so as to allow uranium to be dissolved and removed by leaching liquids.

(k) Standby. Standby means the period of time that an impoundment may not be accepting uranium byproduct materials but has not yet entered the closure period.

(l) Uranium Recovery Facility. A uranium recovery facility means a facility licensed by the NRC or an NRC Agreement State to manage uranium byproduct materials during and following the processing of uranium ores. Common names for these facilities are a conventional uranium mill, an in-situ leach (or recovery) facility and a heap leach facility or pile.

(m) Heap Leach Pile Operational Life. The operational life of a heap leach pile means the time that lixiviant is first placed on the heap leach pile until the time of the final rinse.

3. Section 61.252 is revised to read as follows:

§61.252 Standard.

(a) Conventional Impoundments.

(1) Conventional impoundments shall be designed, constructed and operated to meet one of the two following management practices:

(i) Phased disposal in lined tailings impoundments that are no more than 40 acres in area and shall comply with the requirements of 40 CFR 192.32(a)(1). The owner or operator shall have no more than two conventional impoundments, including existing impoundments, in operation at any one time.

(ii) Continuous disposal of tailings such that tailings are dewatered and immediately disposed with no more than 10 acres uncovered at any time and shall comply with the requirements of 40 CFR 192.32(a)(1).

(b) Non-Conventional Impoundments. Non-conventional impoundments shall meet the requirements of 40 CFR 192.32(a)(1). During operation and until final closure begins, the liquid level in the impoundment shall not be less than one meter.

(c) Heap Leach Piles. Heap leach piles shall comply with the phased disposal management practice in 40 CFR 61.252(a)(1)(i). Heap leach piles shall be constructed in lined impoundments that are no more than 40 acres in area and shall comply with the requirements of 40 CFR 192.32(a)(1). The owner or operator shall have no more than two heap leach piles, including existing heap leach piles, in operation at any one time. The moisture content of heap leach piles shall be maintained at 30% or greater. The moisture content shall be determined on a daily basis, and performed using generally accepted geotechnical methods. The moisture content requirement shall apply during the heap leach pile operational life.

§61.253 [Removed]

4. Section 61.253 is removed.

§61.254 [Removed]

5. Section 61.254 is removed.

6. Section 61.255 is revised to read as follows:

§61.255 Recordkeeping requirements

(a) The owner or operator of any uranium recovery facility must maintain records that confirm that the conventional impoundment(s), nonconventional impoundment(s) and heap leach pile(s) at the facility meet the requirements in 40

CFR 192.32(a)(1). These records shall include, but not be limited to, the results of liner compatibility tests.

(b) The owner or operator of any uranium recovery facility with nonconventional impoundments must maintain records that include measurements confirming that one meter of liquid has been maintained in the nonconventional impoundments at the facility.

(c) The owner or operator of any heap leach facility shall maintain records confirming that the heap leach piles maintained at least 30% moisture content by weight during the heap leach pile operational life.

(d) The records required in paragraphs (a), (b) and (c) above must be kept at the uranium recovery facility for the operational life of the facility and must be made available for inspection by the Administrator, or his authorized representative.

Subject: Ute Mt. Ute Consultation Letter

In anticipation of the FR notice of the Subpart W proposal I drafted a letter to the Chairman of the Ute Mt. Ute requesting consultation. I used a template from the Tribal Handbook, but any comments you have would be appreciated. I assume that once the proposal is published we will have a short window to get this out. Thanks.

Reid

Manuel Heart, Chairman
Ute Mountain Ute Tribe
P.O. Box 6
Towaoc, CO 81334

Dear Chairman Heart:

On ***DATE*** the U.S. Environmental Protection Agency (EPA) proposed revisions to the Radon Emission Standards for Operating Uranium Mill Tailings rule, also known as Subpart W. The purpose of this letter is to invite you to consult.

The EPA is proposing several revisions:

- Clearly stating that the standards apply to all units that contain uranium byproduct material. These units include, but are not limited to:
    - Conventional tailings impoundments.
    - Evaporation ponds or other nonconventional impoundments at uranium recovery facilities.
    - Heap leach piles.
- Propose that all uranium recovery facilities comply with Generally Available Control Technology (GACT) or management practices. This standard requires double liners and leak detection systems.
- Remove the requirement for monitoring radon, but limit the amount of byproduct material that can be exposed.
    - For conventional impoundments, limit tailings exposure using either phased disposal or continuous disposal.
    - For heap leach piles, limit tailings exposure using phased disposal and maintain a 30 % moisture content in the pile.
    - For evaporation ponds, require at least one meter of liquid be constantly maintained in the pond.
- Add definitions for when a uranium recovery facility is in operation or standby.
- Require the owner/operator of a uranium recovery facility to maintain records that confirm that impoundments have been constructed according to the requirements.

The EPA will accept comment for 90 days after the proposed rule is published in the Federal Register on or about ***DATE***. If you wish to initiate government to government consultations with the EPA on this rule, please contact __________------. Please contact us by______in order to request consultation.

We request your input to assure that we develop the best rule possible. We endeavor to conduct our efforts with sensitivity to the needs and culture of your tribe and with attention to the potential impact of our actions. We look forward to hearing from you.

Sincerely,

Jonathan Edwards, Director
Radiation Protection Division

Subject: RE: Please draft a new page for the Subpart W site

Dear Carmen:

Thanks for turning this around so quickly. We are scanning some references and will have to add them. In the meantime, here are some changes to the page:

A. Here are the links that aren't working:

1) Jackson, A., 2009. "EPA's Fuzzy Bright Line Approach to Residual Risk," Ecology Law Quarterly, Vol. 35:439, 2009.
http://www.boalt.org/elq/documents/elq36-2-00-infelise-2009-0620.pdf

2) SRK Consulting 2010a. "Powertech Uranium Corp., NI 43-101 Preliminary Assessment, Dewey-Burdock Project, Custer and Fall River Counties, South Dakota," July 6, 2010.
http://www.powertechuranium.com/i/pdf/DB_PEA_SRK_RPT_20100706.pdf

B. Please make the first bullet the second line of the title, so that it is like this:

EIA References
References from "Background Information Document Economic Impact Analysis in Support of the Subpart W Proposed Rulemaking" (138 pp, 2.24 MB) About PDF

C. Thanks for your suggestion about breaking the references up into categories, but unfortunately, we have to present them as they appeared in EIA document.

D. Please add spaces between the bullets to make the page easier to read.

E. Please add the disclaimer to all non-government links.

Subject: RE: Please draft a new page for the Subpart W site

Hi Tony,

Here is the draft page with the information you provided.
http://epastage.epa.gov/staging1/rpd/neshaps/subpartw/eiareferences.html
The references page is a long page. It will probably be easier to view this page by adding categories to the long list of bullets.

FYI – Beth is no longer doing web work. Attached is the file with all the Radiation pages divided between Marisa and Carmen. Please send any web requests to both of us at all times and we will take care of it accordingly.

Subject: Please draft a new page for the Subpart W site

Dear Carmen:

We now need a reference page on the Subpart W website. Please draft a page to be called:

http://www.epa.gov/radiation/neshaps/subpartw/eiareferences.html

The page content is attached in a Word file. Some entries are highlighted because we don't have links for them yet—please ignore the highlighting and add them to the web page. Please post to the test server so that everyone can review it before publishing it to the web server.

Thanks for your help!

Hi Beth,

Here are a couple of presentations and some meeting notes for the Subpart W docket:

1) Presentation to the NRC/NMA Uranium Recovery Conference, June 2014
2) Presentation to the National Tribal Air Association, June 2014
3) Meeting notes between EPA and the Ute Mountain Ute Tribe, june 2014

Thanks!

Reid

U.S. EPA Regulations Review Update:
Subpart W NESHAPS (40 CFR 61)

Reid J. Rosnick

Radiation Protection Division

U.S. Environmental Protection Agency

National Tribal Air Association
NTAA-EPA Air Policy Call
June 26th, 2014

Review of 40 CFR 61 Subpart W

- National Emission Standard for Hazardous Air Pollutants (NESHAP) for radon emissions for operating mill tailings
- Review began after receiving Notice of Intent to Sue (NOI) by two Colorado environmental groups
  - Based on EPA's alleged failure to review & revise regulation within ten years after enactment of Clean Air Act Amendments of 1990 (11/15/2000)
  - Plaintiffs filed suit against EPA
  - Settlement agreement reached November 2009

Existing Subpart W Summary

- Applies to radon emissions from operating uranium mill tailings
  - Radon emissions flux standard: 20 pCi/m^2/sec
- After 12/15/1989, new impoundments were required to meet one of two new work practices:
  - ✓ Phased disposal – Impoundment size(2) $\leq$ 40 acres
  - ✓ Continuous disposal – dewatered tailings with no more than 10 acres uncovered
  - ✓ Both must meet design, construction, ground-water monitoring standards at 40 CFR 192.32(a)
- Work practices were designed to achieve at least equivalent risk reductions as obtained by the numerical standard

Existing Subpart W, continued

- Regulation originally written with emphasis on conventional impoundments
- In Situ Leach/Recovery (ISL/ISR) extraction has become more commonplace since original promulgation
  - ✓ Does not generate significant tailings
  - ✓ Wastes containing uranium byproduct material are placed in evaporation ponds/impoundments
- ISL/ISR, conventional mill, heap leach operations expected

Proposed Subpart W Revisions

- EPA is proposing several revisions (under authority of the Clean Air Act Amendments of 1990):
  - ✓ Clearly stating that the standards apply to all units that contain uranium byproduct material. These units include, but are not limited to:
    - conventional tailings impoundments
    - evaporation ponds or other nonconventional impoundments at uranium recovery facilities
    - heap leach piles

Proposed Subpart W Revisions, cont.

- Propose that all uranium recovery facilities comply with Generally Available Control Technology (GACT), or management practices
  - ✓ Management practices incorporate existing “work practices” for conventional impoundments
  - ✓ Management practices also specified for evaporation ponds and heap leach piles
  - ✓ This standard requires double liners and leak detection systems per 40 CFR 192.32(a)

Proposed Subpart W Revisions, cont.

- Proposed GACT removes the requirement for monitoring radon, but still limits the amount of byproduct material that can be exposed
  - ✓ For conventional impoundments, limit tailings exposure using either phased disposal or continuous disposal
  - ✓ For heap leach piles, limit tailings exposure using phased disposal and maintain a 30 % moisture content in the pile
  - ✓ For evaporation ponds, require at least one meter of liquid be constantly maintained in the pond

Proposed Subpart W Revisions, cont.

- Add definitions for:
  - ✓ uranium recovery facility
  - ✓ operation and standby
  - ✓ Conventional impoundment
  - ✓ non-conventional impoundment
  - ✓ heap leach pile
- Require the owner/operator of a uranium recovery facility to maintain records that confirm that impoundments have been constructed according to the requirements

Outreach

- Presentations made in Gallup, NM, Rapid City, SD, Denver, CO, Ute Mountain Ute Recreation Center (White Mesa)
- Dedicated website: (www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html
- Quarterly stakeholder conference calls (July 3, 866-299-3188, code 2023439563#)
- Letters requesting consultation sent to 55 tribes
- Consultation requested by Ute Mountain Ute

Comments/Public Hearing

- The proposed rule was published in the *Federal Register* on May 2, 2014 (79 FR 25388)
- EPA will accept comment until July 31, 2014 (90 days after the proposed rule was published)
- EPA has received requests to extend comment period. Extension will be granted - time has not been decided
- Public hearing will be held during the comment period

U.S. EPA Regulations Review Update:
Subpart W NESHAPS (40 CFR 61)
Uranium and Thorium Mill Tailings (40 CFR Part 192)

Andrea Cherepy, Phil Egidi, Reid Rosnick

Radiation Protection Division

U.S. Environmental Protection Agency

NRC/NMA Uranium Recovery Workshop

June 18-19, 2014

Review of 40 CFR 61 Subpart W

- National Emission Standard for Hazardous Air Pollutants (NESHAP) for radon emissions for operating mill tailings
- Review began after receiving Notice of Intent to Sue (NOI) by two Colorado environmental groups
  - ✓ Based on EPA's alleged failure to review & revise regulation within ten years after enactment of Clean Air Act Amendments of 1990 (11/15/2000)
  - ✓ Plaintiffs filed suit against EPA
  - ✓ Settlement agreement reached November 2009

Existing Subpart W Summary

- Applies to radon emissions from operating uranium mill tailings
  - Radon emissions flux standard: 20 pCi/m^2/sec
- After 12/15/1989, new impoundments were required to meet one of two new work practices:
  - ✓ Phased disposal – Impoundment size(2) $\leq$ 40 acres
  - ✓ Continuous disposal – dewatered tailings with no more than 10 acres uncovered
  - ✓ Both must meet design, construction, ground-water monitoring standards at 40 CFR 192.32(a)
- Work practices were designed to achieve at least equivalent risk reductions as obtained by the numerical standard

Existing Subpart W, continued

- Regulation originally written with emphasis on conventional impoundments
- In Situ Leach/Recovery (ISL/ISR) extraction has become more commonplace since original promulgation
  - ✓ Does not generate significant tailings
  - ✓ Wastes containing uranium byproduct material are placed in evaporation ponds/impoundments
- ISL/ISR, conventional mill, heap leach operations expected

Proposed Subpart W Revisions

- EPA is proposing several revisions (under authority of the Clean Air Act Amendments of 1990):
  - ✓ Clearly stating that the standards apply to all units that contain uranium byproduct material. These units include, but are not limited to:
    - conventional tailings impoundments
    - evaporation ponds or other nonconventional impoundments at uranium recovery facilities
    - heap leach piles

Proposed Subpart W Revisions, cont.

- Propose that all uranium recovery facilities comply with Generally Available Control Technology (GACT), or management practices
  - ✓ Management practices incorporate existing "work practices" for conventional impoundments
  - ✓ Management practices also specified for evaporation ponds and heap leach piles
  - ✓ This standard requires double liners and leak detection systems per 40 CFR 192.32(a)

Proposed Subpart W Revisions, cont.

- Proposed GACT removes the requirement for monitoring radon, but still limits the amount of byproduct material that can be exposed
  - ✓ For conventional impoundments, limit tailings exposure using either phased disposal or continuous disposal
  - ✓ For heap leach piles, limit tailings exposure using phased disposal and maintain a 30 % moisture content in the pile
  - ✓ For evaporation ponds, require at least one meter of liquid be constantly maintained in the pond

Proposed Subpart W Revisions, cont.

- Add definitions for:
  - ✓ uranium recovery facility
  - ✓ operation and standby
  - ✓ Conventional impoundment
  - ✓ non-conventional impoundment
  - ✓ heap leach pile
- Require the owner/operator of a uranium recovery facility to maintain records that confirm that impoundments have been constructed according to the requirements

Comments/Public Hearing

- The proposed rule was published in the *Federal Register* on May 2, 2014 (79 FR 25388)
- EPA will accept comment until July 31, 2014 (90 days after the proposed rule was published)
- A public hearing will be held during the comment period

40 CFR 192 - Status

- EPA plans to revise its regulations for uranium and thorium milling
- Regulatory changes will focus on groundwater protection, restoration and stability at ISR sites
- Revisions are currently undergoing interagency review
- Anticipate *Federal Register* publication this fall with public hearings soon thereafter

40 CFR 192 - Background

- Issued under authority of Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978
- Establishes standards protective of public health, safety and the environment for active and closed mill sites
- Addresses residual radioactive material at Title I (inactive) sites and byproduct material at Title II (active) sites
- Issued in 1983; last revised in 1995

40 CFR 192 – Taking Into Account ISR

- ISR now dominant form of uranium extraction in the US
- ISR directly alters groundwater chemistry
- Current standards lack explicit provisions for ISR operations
- NRC and Agreement States use license conditions to protect public health, safety and the environment
- *We plan to propose an additional subpart focused on uranium in-situ recovery*

40 CFR 192 – Primary Objectives for Rule Revisions

- Ensure that background groundwater conditions are adequately characterized
  - ✓ ... with enough detail to provide the data necessary to help determine when groundwater restoration has occurred
- Align groundwater standards in the revised rule with current regulatory criteria
- Ensure that groundwater is stable and likely to stay that way
  - ✓ ...by providing detailed requirements regarding restoration metrics and post-restoration monitoring

40 CFR 192 – Next Steps

- Proposal submitted to OMB for Executive Order 12866 review in late April
- We expect the proposal will be published in the *Federal Register* this fall
- Comments will be accepted for 90 days after publication date

Memo to: Docket EPA-HQ-OAR-2008-0218

Subject: 6-25-14 meeting with Ute Mountain Ute Tribe to discuss preparations for the July 10, 2014 consultation between EPA and the Tribe on EPA's current proposed regulation at 40 CFR 61

From: Reid J Rosnick, Radiation Protection Division

Members of EPA: Reid Rosnick, Tom Peake, Pat Childers, Jed Harrison, Angelique Diaz, Scott Patefield, Scott Jackson, Art Palomares

Ute Mt. Ute Tribe representatives: Scott Clow, Celine Hawkins, Colin Larrick, Mike Keller, Tomoe Natori

Scott Clow noted that the consultation is scheduled for July 10, 2014 beginning at approximately 9 am, MDT. He will arrange for a conference call-in line. EPA noted that members of Region 8 will attend while members of ORIA will call in. The consultation will be about the proposed Subpart W rulemaking, but may dovetail into other areas the Tribe has discussed. For instance, if any time remains, we could discuss the off-site or alternate feed issues. It was noted that Region 8, the Tribe and the state of Utah will be holding a meeting in a month or so to discuss issuers related to enforcement and the off-site rule.

EPA, Scott and Celine discussed the questions/answers to be discussed during the consultation:

The meeting was then adjourned.

William,

Jon Edwards asked me to send you some information on NESHAP Subpart W. As luck would have it, I just gave a generalized briefing to the National Tribal Air Association. It will give you a brief update on the proposed rule, as well as the outreach we have performed over the past four years. Please feel free to contact me if you have further questions or comments.

U.S. EPA Regulations Review Update:
Subpart W NESHAPS (40 CFR 61)

Reid J. Rosnick

Radiation Protection Division

U.S. Environmental Protection Agency

National Tribal Air Association
NTAA-EPA Air Policy Call
June 26th, 2014

Review of 40 CFR 61 Subpart W

- National Emission Standard for Hazardous Air Pollutants (NESHAP) for radon emissions for operating mill tailings
- Review began after receiving Notice of Intent to Sue (NOI) by two Colorado environmental groups
  - Based on EPA's alleged failure to review & revise regulation within ten years after enactment of Clean Air Act Amendments of 1990 (11/15/2000)
  - Plaintiffs filed suit against EPA
  - Settlement agreement reached November 2009

Existing Subpart W Summary

- Applies to radon emissions from operating uranium mill tailings
  - Radon emissions flux standard: 20 pCi/m^2/sec
- After 12/15/1989, new impoundments were required to meet one of two new work practices:
  - ✓ Phased disposal – Impoundment size(2) ≤ 40 acres
  - ✓ Continuous disposal – dewatered tailings with no more than 10 acres uncovered
  - ✓ Both must meet design, construction, ground-water monitoring standards at 40 CFR 192.32(a)
- Work practices were designed to achieve at least equivalent risk reductions as obtained by the numerical standard

Existing Subpart W, continued

- Regulation originally written with emphasis on conventional impoundments
- In Situ Leach/Recovery (ISL/ISR) extraction has become more commonplace since original promulgation
  - ✓ Does not generate significant tailings
  - ✓ Wastes containing uranium byproduct material are placed in evaporation ponds/impoundments
- ISL/ISR, conventional mill, heap leach operations expected

Proposed Subpart W Revisions

- EPA is proposing several revisions (under authority of the Clean Air Act Amendments of 1990):
  - ✓ Clearly stating that the standards apply to all units that contain uranium byproduct material. These units include, but are not limited to:
    - conventional tailings impoundments
    - evaporation ponds or other nonconventional impoundments at uranium recovery facilities
    - heap leach piles

Proposed Subpart W Revisions, cont.

- Propose that all uranium recovery facilities comply with Generally Available Control Technology (GACT), or management practices
  - ✓ Management practices incorporate existing “work practices” for conventional impoundments
  - ✓ Management practices also specified for evaporation ponds and heap leach piles
  - ✓ This standard requires double liners and leak detection systems per 40 CFR 192.32(a)

Proposed Subpart W Revisions, cont.

- Proposed GACT removes the requirement for monitoring radon, but still limits the amount of byproduct material that can be exposed
  - ✓ For conventional impoundments, limit tailings exposure using either phased disposal or continuous disposal
  - ✓ For heap leach piles, limit tailings exposure using phased disposal and maintain a 30 % moisture content in the pile
  - ✓ For evaporation ponds, require at least one meter of liquid be constantly maintained in the pond

Proposed Subpart W Revisions, cont.

- Add definitions for:
  - ✓ uranium recovery facility
  - ✓ operation and standby
  - ✓ Conventional impoundment
  - ✓ non-conventional impoundment
  - ✓ heap leach pile
- Require the owner/operator of a uranium recovery facility to maintain records that confirm that impoundments have been constructed according to the requirements

Outreach

- Presentations made in Gallup, NM, Rapid City, SD, Denver, CO, Ute Mountain Ute Recreation Center (White Mesa)
- Dedicated website: (www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html
- Quarterly stakeholder conference calls (July 3, 866-299-3188, code 2023439563#)
- Letters requesting consultation sent to 55 tribes
- Consultation requested by Ute Mountain Ute

Comments/Public Hearing

- The proposed rule was published in the *Federal Register* on May 2, 2014 (79 FR 25388)
- EPA will accept comment until July 31, 2014 (90 days after the proposed rule was published)

Subject: RE: Question on copyrighted materials and rulemaking

Hi Tony,

As mentioned in the docket section of these FR templates, there are certain restrictions when dealing with copyrighted material, CBI or any other material restricted by statute:

"All documents in the docket are listed in the www.regulations.gov index. Although listed in the index, some information is not publicly available, e.g., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy."

So for those stakeholders that want access to copyrighted material, they will have to request hard copies individually.

Thanks,

Ray

Jonathan, thanks for sharing. It reminds me that I've heard of Subpart W a few times but that I'm not sure I know much about it. If you have a general presentation or briefing doc lying around, no matter how out of date, I'd be curious just to know what it is.
Thanks!
-Wm.

Subject: FW: Ute mountain questions

William --- This is simply an FYI note, to pass on a list of questions that our program received from the Ute Mountain Ute Tribe on our NESHAPS Subpart W rulemaking and related issues. Josh Lewis in OCIR has also received a copy. We thought that it would be good for you to see this since Senator Udall's staff (Colorado) has been contacted by the Ute Mountain Ute's on this issue, and we had a staff-level/OCIR discussion with Sen Udall's staff this past Friday that went fairly well. Any questions, just give us a call or email. Take care, Jon

Subject: Ute mountain questions

Attached is the list of questions on Subpart W from the Ute.
For clarification: There is a discussion of these questions with the Ute mountain tribe on Wed at 2 pm, with an internal EPA discussion on Tuesday at noon.

Dear Reid,

Thank you for attending my webinar. We hope you enjoyed our event.

Please send your questions, comments and feedback to: monica.begaye@nau.edu.

Subject: References from Background Document that are not available on line

Dear Reid:

Attached is a list of references from the Background Information Document that are not available on line. They fall into three categories—

1. Federal Register notices that are too old to be found on line.
2. Copyrighted materials
3. References that have been updated with new materials.

We can scan the Federal Register notices after we get them, but I am not sure how to handle the copyrighted materials. I'll see if Ray Lee has any insights on this.

Tony Nesky

Subject: Please draft a new page for the Subpart W site

Dear Carmen:

We now need a reference page on the Subpart W website. Please draft a page to be called:

http://www.epa.gov/radiation/neshaps/subpartw/eiareferences.html

The page content is attached in a Word file. Some entries are highlighted because we don't have links for them yet—please ignore the highlighting and add them to the web page. Please post to the test server so that everyone can review it before publishing it to the web server.

Thanks for your help!

Re: Notification of Consultation and Coordination on the 40 CFR Part 61 Subpart W Rulemaking

Dear Chairman Heart:

The U.S. Environmental Protection Agency has received your letter requesting a consultation regarding the 40 CFR Part 61 Subpart W Rulemaking. On behalf of the U.S. Environmental Protection Agency's Office of Air and Radiation (OAR), I am writing to confirm the meeting between the Ute Mountain Indian Tribe, the U.S. EPA's OAR, and the U.S. EPA's Region 8.

This meeting is scheduled pursuant to your request at **9 a.m. to 11:30 a.m., Mountain Daylight Time, on Thursday, July 10, 2014,** and will be conducted in accordance with the *EPA Policy on Consultation and Coordination with Indian Tribes* (www.epa.gov/tribal/consultation/consult-policy.htm).

The official EPA contact for this consultation and coordination process is the EPA Region 8 Tribal Assistance Program Director, Alfreda Mitre. Please do not hesitate to contact Ms. Mitre at (303) 312-6343, or by email at mitre.alfreda@epa.gov if you have any questions.

We look forward to this consultation session and to discussing this important matter.

Sincerely,

Shaun L. McGrath
Regional Administrator

Hi Reid,

I want to clarify that it is the Region's understanding that HQ will take the lead on the Proposed Subpart W rule, Tribal Consultation conversation that will occur on July 10th. Also, it's my understanding that you will provide us with a conference line telephone number, is that correct?

I would like to clarify during today's call that the July 10th call is limited to a Tribal Consultation on the Proposed Subpart W rule. So, if I could have a minute to make this point during today's call, I would appreciate it.

Thanks!

Art Palomares, Director
Water Technical Enforcement Program

Reid,

Thanks. Deb Thomas, the Assistant Regional Administrator will be attending the Consultation on-site at the Tribal office. Also, attending in person will be Alfreda Mitre, Tribal Advisor to the Regional Administrator, and Angelique Diaz.

I need the conference telephone line, so that I can be part of the conversation and so that we can have the right folks should other issues come up unrelated to rulemaking.

Hi Art,

This is a good point that you have raised, and I think we should make sure that we are all on the same page when we discuss it with the tribe this afternoon.

It's my feeling that the tribe will want to discuss many things related to the uranium recovery process. HQ will most definitely take the lead on issues related to the Subpart W rulemaking activity, and I'll ask the tribe today if they want us to provide a conference call line. It is entirely possible that the tribe will want to discuss issues related to enforcement or to state oversight (we cannot limit them on what they want to discuss), and that's why we went through their questions yesterday, in order to decide who will be necessary either in person, through your RA or DSRA, or on a call line. The questions that are not related to the rulemaking were usually enforcement related or issue with Utah.

Subject: Follow up re Radon Emissions proposed rule?

Jacqueline/Carly,

Just following up after the call we had last Friday. As I recall, you want to talk further w/ EPA Regional staff who are familiar with the interactions we've had with the state of UT, specifically with regard to the white mesa mill. I'm cc'ing Paula in our Region 8 office, who can set up a call w/ her colleagues there to discuss this further. Will let you all take it from here in terms of scheduling.

Subject: Time to chat about recent Radon Emissions proposed rule?

Hi Josh,

Hopefully you're the right person to flag this for. I handle Native American issues for Senator Mark Udall and one of our tribes, the Ute Mountain Ute Tribe, has brought an important issue to our attention. They have some serious concerns with EPA's May proposed rule on the National Emission Standards for Radon Emissions from Operating Mill Tailings.

Do you have time this week to chat with me and my colleague Carly (she handles energy/environment issues) about this issue in further depth? Please let us know some times that work for you.

Thank you,

Jacqueline Thomas

Subject: Completed Links

Here is the list, I am not sure what it was but I could not find any of the Federal Register links, maybe I was just looking them up wrong or didn't know what I was looking at but I couldn't seem to find them.

They have been highlighted in the document.

Andrew

Subject: Re: FW: List of References Not Available on-line

here is the link for the second one: http://www.radiationcontrol.utah.gov/Uranium_Mills/IUC/Denison_IUC/docs/2011/reclamationplan50/recplan5_0.pdf

I found the link on the website for the first one, however there was nothing that matched that from 2007. There was only 2012 and 2010, but you can see what I am talking about here: http://www.radiationcontrol.utah.gov/Uranium_Mills/IUC/Denison_IUC/docs/2011/reclamationplan50/recplan5_0.pdf

Hope this helps.

Andrew

To: Nesky, Anthony
Subject: RE: List of References Not Available on-line

Hi Tony,

A quick glance at the list tells me that it can be even shorter that it is. For example,

- Denison Mines (USA) Corp., 2007. "White Mesa Uranium Mill License Renewal Application, State of Utah Radioactive Materials License No.UT1900479, Volume 4 - Environmental Report," February 28, 2007.

- Denison Mines (USA) Corp., 2011. "Reclamation Plan, White Mesa Mill Blanding, Utah, Radioactive Materials License No. UT1900479," Revision 5.0, September 2011.

Can most likely be found at the Utah web site

http://www.radiationcontrol.utah.gov/Uranium_Mills/denison/index.htm

Once we narrow the list to the shortest possible all these document links need to be posted to the Subpart W website under the reference section for the BID/EIA. Concurrently we then need to get them in the docket so there can be no claim of us "hiding" information from stakeholders.

For the documents that absolutely cannot be found we need to go to SC&A and find them, scan them if necessary, and then post them to the website/docket.

Subject: RE: Court Reporter Needed?

Dear Anqelique:

Do you know what the procedure would be for us to provide Region 8 with money for the court reporter? We had planned on using the SRA contract to hire a court report, but the contract which we were using expired, and we will have to fund a new Task Order. I wonder if it will be simpler/cheaper to fund Region 8. Thanks, again, for your help!

Also, I sent you a draft scope of work for the contractor. How many helpers would you like in Denver?

Subject: Court Reporter Needed?

It has come to my attention that a court reporter is needed for the Subpart W public hearing. Let me know what kind of help you need from Region 8 in identifying one. I am told that for previous hearings HQ provided the money and the Region found the reporter.

Thanks,
Angelique

Hello Jacqueline and Carly – I was hoping to set up a call today with you and our Air Program staff regarding White Mesa Mill in Utah. Would either 11:30 or 5:00 EST work for you? If so, please 'reply all' and we will give you a call at any number you suggest. Thanks. Look forward to talking with you.

Subject: Follow up re Radon Emissions proposed rule?

Jacqueline/Carly,

Just following up after the call we had last Friday. As I recall, you want to talk further w/ EPA Regional staff who are familiar with the interactions we've had with the state of UT, specifically with regard to the white mesa mill. I'm cc'ing Paula in our Region 8 office, who can set up a call w/ her colleagues there to discuss this further. Will let you all take it from here in terms of scheduling.

Subject: Time to chat about recent Radon Emissions proposed rule?

Hi Josh,

Hopefully you're the right person to flag this for. I handle Native American issues for Senator Mark Udall and one of our tribes, the Ute Mountain Ute Tribe, has brought an important issue to our attention. They have some serious concerns with EPA's May proposed rule on the National Emission Standards for Radon Emissions from Operating Mill Tailings.

Do you have time this week to chat with me and my colleague Carly (she handles energy/environment issues) about this issue in further depth? Please let us know some times that work for you.

Thank you,

Jacqueline Thomas

Re: Request for 120-Day Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick and Nesky,

On behalf of Uranium Watch, Eastern Navajo Dine Against Uranium Mining, Laguna Acoma Coalition for a Safe Environment, Bluewater Valley Downstream Alliance, Nuclear Information and Resource Service, Earthworks, Western Colorado Congress, Nebraska Chapter of the Sierra Club, Grand Valley Peace and Justice, Western Nebraska Resource Council, Arizona Mining Reform Coalition, the Multicultural Alliance for a Safe Environment, and Tallahassee Area Community, Inc, we urge you to extend the public comment period deadline for an additional 120 days beyond the current deadline of July 31st, 2014 for the proposed rulemaking affecting 40 CFR Part 61, subpart W.

Given the complexity of this rule, and our desire to understand its implications to communities affected by radon emissions, we believe more time is needed to formulate meaningful comments to EPA and help maximize additional public participation, which should also include hearings in affected areas.

Thanks for your consideration. If you have concerns, questions, or comments, please direct them to the following email addresses.

Radon Emissions from Uranium Mills: As you might remember we submitted a request for a comment period extension that will be discussed on the June 26th EPA Policy call. The rule makers on this, Reid Rosnick, informed me earlier that they are granting the extension but not clear on how long. Cristina and I have been gathering information on this draft rule and will begin the PRK process on this next week as well. Bob Gruenig will also help review and craft this PRK in the coming weeks.

Subject: FW: List of References Not Available on-line

From: Rosnick, Reid
Sent: Tuesday, June 24, 2014 7:02 AM
To: Nesky, Anthony
Subject: RE: List of References Not Available on-line

Hi Tony,

A quick glance at the list tells me that it can be even shorter that it is. For example,

- Denison Mines (USA) Corp., 2007. "White Mesa Uranium Mill License Renewal Application, State of Utah Radioactive Materials License No.UT1900479, Volume 4 - Environmental Report," February 28, 2007.
- Denison Mines (USA) Corp., 2011. "Reclamation Plan, White Mesa Mill Blanding, Utah, Radioactive Materials License No. UT1900479," Revision 5.0, September 2011.

Can most likely be found at the Utah web site

http://www.radiationcontrol.utah.gov/Uranium_Mills/denison/index.htm

Once we narrow the list to the shortest possible all these document links need to be posted to the Subpart W website under the reference section for the BID/EIA. Concurrently we then need to get them in the docket so there can be no claim of us "hiding" information from stakeholders.

For the documents that absolutely cannot be found we need to go to SC&A and find them, scan them if necessary, and then post them to the website/docket.

Hey Reid,

This information is already up live. During our call with Susan you asked me to move that information from the table this section below. My apologies if I misunderstood your request. Let me know if you want me to back.

Requests for Extension of the Public Comment Period

EPA has received two requests for EPA to extend the public comment period for the proposed rulemaking for NESHAP Subpart W. The public comment period currently ends on July 31, 2014. The requestors have asked EPA to extend the public comment period by 120 days. EPA plans to extend the public comment period in response to these requests but has not yet determined the length of that extension. EPA will publish a Federal Register notice when it finalizes its decision regarding the extension of the public comment period. EPA will also post information regarding the extension of the public comment period on this website as soon as it has been finalized. Interested parties should check this website for updates.

Re: Request for Extension of Comment Deadline, Docket ID No. EPA-HQ-OAR-2008-0218

Dear Mr. Rosnick,

Please extend the public comment period for EPA's Rulemaking for Revisions to the National Emission Standards for Radon Emissions from Operating Mill Tailings. Comments are due July 31, 2014, but EPA should consider extending the deadline by 120 days.

As you know, the Subpart W Rulemaking is of critical importance to affected communities and people who live in Uranium Country and there is a high degree of interest in participating in the rulemaking as well as a high degree of interest in seeing the current rule strengthened. It is also a serious, complex rule that is difficult for lay people to grapple with and it takes a lengthy amount of time to study the issues and prepare responses. A number of organizations who have a stake in the rulemaking represent community members who lack the resources that industry has to hire technical experts and services to review the rule. EPA should extend the deadline by a considerable period and accommodate the legitimate need for more time that affected citizens have in this process. This will result in a better decision-making process by increasing people's ability to participate.

Thank you again for your consideration.

Sincerely,

Jennifer Thurston
Director

Subject: FW: Ute mountain questions

William --- This is simply an FYI note, to pass on a list of questions that our program received from the Ute Mountain Ute Tribe on our NESHAPS Subpart W rulemaking and related issues. Josh Lewis in OCIR has also received a copy. We thought that it would be good for you to see this since Senator Udall's staff (Colorado) has been contacted by the Ute Mountain Ute's on this issue, and we had a staff-level/OCIR discussion with Sen Udall's staff this past Friday that went fairly well. Any questions, just give us a call or email. Take care, Jon

Subject: Ute mountain questions

Attached is the list of questions on Subpart W from the Ute.
For clarification: There is a discussion of these questions with the Ute mountain tribe on Wed at 2 pm, with an internal EPA discussion on Tuesday at noon.

UTE MOUNTAIN UTE TRIBE'S INITIAL QUESTIONS
Environmental Protection Agency, Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings, Proposed Rule
40 C.F.R. Part 61
Submitted on June 13, 2014 in preparation for government-to-government consultation, July 10, 2014

I. EPA, INDIAN TRIBES, AND EXECUTIVE ORDER 13175

1. The Environmental Protection Agency's (EPA) statement regarding compliance with Executive Order 13175 states that the Subpart W rulemaking action does not have "tribal implications" because the rulemaking does not impose regulatory requirements on tribal governments. Please be prepared to discuss how the following issues impact the EPA's Executive Order 13175 analysis:

    - Although Native Americans make up only 1.4 percent of Utah's racial profile (and 0.9 percent of the United States' racial profile), they make up 55.8 percent of the racial profile for San Juan County, Utah (the county where the White Mesa Mill (WMM) is located).
    - The WMM facility is located on aboriginal lands of the Ute Mountain Ute Tribe.
    - The WMM facility is located adjacent to land and other Indian Trust Assets held in trust by the United States on behalf of the Ute Mountain Ute Tribe (and less than 3 miles from the nearest Tribal resident).
    - The Tribal community located in White Mesa is downgradient of the WMM facility.
    - The Tribal community located in White Mesa is completely dependent on groundwater supplies located underneath the WMM facility and tailings cells.
    - Activities and operations at the WMM have already impacted Tribal members' abilities to use surface, plant, wildlife, and surface water resources on public and Tribal lands.

2. Please be prepared to discuss how the EPA will address Tribal concerns during this Subpart W rulemaking and related rulemaking processes (including, but not limited to, the anticipated revision to 40 C.F.R. Part 192).

3. Please be prepared to discuss how or whether the EPA undertook analysis of how this rulemaking will impact UMU Tribal members, UMU Tribal lands, and Indian Trust Assets.

II. NESHAPS/CLEAN AIR ACT QUESTIONS

4. Has the EPA evaluated establishing a lesser quantity or different criteria for major sources of radionuclides under Section 112(a)(1) of the CAA? *See* footnote 2, page 25390 of the proposed rulemaking (noting that *none* of the uranium recovery facilities are major sources under NESHAPS).

5. On page 25390 of the proposed rulemaking, the EPA identifies the "source category" for Subpart W using 40 C.F.R. § 61.250 and the proposed definition of "uranium recovery facility." Has the EPA listed uranium recovery facilities as a category or subcategory of sources under Section 112(c) of the Clean Air Act? If so, please provide an explanation and documentation in advance of the consultation meeting.

6. On page 25390 of the proposed rulemaking, the EPA states, "Subpart W requirements specifically apply to the affected sources at the uranium recovery facilities that are used to manage or contain the uranium byproduct material or tailings." However, the proposed Subpart W rulemaking only covers some HAP sources at uranium recovery facilities, and not others (such as stackhouses, ore pad, ore grinder, and the Mill yard, see Question 7, *infra*). Please explain the EPA's rationale for excluding such HAP sources at conventional uranium mills.

7. On page 25390 of the proposed rulemaking, the EPA states: "We presently have no data or information that shows any other HAPs being emitted from these impoundments." Please provide a response to the following initial questions, data, and information regarding other HAPs that may be emitted from the WMM.

    - The WMM's 10 C.F.R. § 40.65 environmental airborne particulate monitoring program monitors for natural uranium (Uranium-238, Uranium-234, Uranium-235), Thorium-230, Radium-226, and Lead-210. This air monitoring program has detected all four isotopes at all of the air monitoring stations. Additionally, the WMM has identified Lead-210, Thorium-230, Thorium-232, Polonium-210, Radium-226, and Radium-228 in wastewater samples from the tailings impoundments. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
    - The WMM processes uranium ore. During the uranium storage and milling processes, there may be more than three dozen radioactive isotopes present at the WMM facility (including actinium, astatine, bismuth, francium, lead, polonium, protactinium, radium, radon, thallium, thorium, and uranium). *See* Uranium Decay Series diagram on page 44 of the Technical and Regulatory Support document. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
    - The WMM's uranium milling process uses significant quantities of chemicals (sodium chlorate is used during ore oxidation; sulfuric acid and flocculants are used during the leaching and clarification; secondary amines/kerosene, tri-alkyl amines/tributyl phosphate modifier, and quaternary ammonium compounds/alcohol are used during the solvent extraction; chlorides and sulfates are used during pregnant liquor stripping; and ammonia hydroxide and sodium hydroxide during yellowcake precipitation). During the storage and use of these chemicals, and after these chemicals are disposed in the tailings impoundments, there may be significant emissions of HAPs at the WMM.

- The WMM processes alternate feed materials. During the alternate feed storage and milling processes, other radioactive isotopes, non-metal compounds, and other regulated HAPs may be emitted from the WMM.
- The WMM processes vanadium ore. Vanadium is considered to be dangerous to life and health by both the Occupational Safety and Health Administration and the National Institute for Occupational Safety and Health, and may be listed as a HAP in the future. The WMM's vanadium recovery process uses a significant quantity of chemicals (sodium chlorate is used during the redox/pH adjustment; kerosene and secondary amines are used during the solvent extraction; soda ash is used during the vanadium pregnant liquor stripping process; and ammonia hydroxide is used during the vanadium precipitation). This indicates that the vanadium recovery process results in the emission of HAPs other than Radon-222 from the WMM facility.

8. On page 25390 of the proposed rulemaking, the EPA states that it evaluated the MACT standards applicable to major sources in the same industrial sector. Please provide the Tribe with this analysis prior to the consultation, and be prepared to explain the MACT analysis that the EPA performed during this rulemaking process.

9. Please explain how the EPA evaluated the use of a work practice standard, rather than an emissions standard, for the control of a HAP under the proposed rulemaking. *See* Section 112(h), Clean Air Act. Please specifically address the EPA's determination to remove the current emissions standard for existing impoundments. Please also explain how removing the emissions standard from Subpart W will affect: (a) how the WMM facility sets and meets the ALARA goal to protect worker and adjacent communities from radionuclides; and (b) monitoring of radon emissions under 10 C.F.R. Part 40, Appendix A.

III. SUBPART W AND CLOSURE OF LEGACY IMPOUNDMENTS

10. In 1989, when the EPA proposed the current Subpart W NESHAP, the EPA concluded that, "Existing mill tailing piles are large piles of waste that emit radon. There is nothing that can be done to reduce the amount of radon they emit except cover them." 54 FR 9644 (March 7, 1989). EPA crafted Subpart W to prohibit uranium mills from having more than two tailings impoundments in operation. Explain why the EPA has not required closure of the legacy Tailings Cells 1, 2, and 3 at the WMM, as contemplated and required by the current NESHAP.

11. In this proposed rulemaking, the EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Explain how the EPA can justify the long-term risk of having almost 300 acres of tailings impoundments that are either in operation or in closure but without a permanent radon barrier at the WMM. *See also* questions on conventional and non-conventional impoundments.

IV. DEFICIENT OR INCORRECT ANALYSIS OF OPERATIONS AND FACILITIES AT THE WMM

12. The owners of the WMM state in the June 1, 2009 letter response to EPA's CAA Section 114 Information Request that Tailings Cells 1, 2, and 3 meet the requirements of 40 C.F.R. 192.32(a). The WMM owners specify that these specific Tailings Cells meet the design and operating requirements under 40 C.F.R. 264.221(a). Please explain how the EPA evaluated the WMM owners' assertions regarding compliance with 40 C.F.R. 192.32(a) and 40 C.F.R. 264.221(a), given the following:
    - The liners in Tailings Cells 1, 2, and 3 were designed for a 15-year life and were installed between May 1980 and September 1982. These impoundments have already been in operation for over 30 years.
    - Contamination of the shallow groundwater underlying Tailings Cells 1, 2, and 3 has been documented and is the subject of investigation and corrective action to address elevated chloroform, nitrate and chlorides. There is significant evidence that the liners on Tailings Cells 1, 2, and 3 have already allowed migration of waste out of the impoundments into the adjacent groundwater.
    - The Agreement State and the WMM owners treat the shallow groundwater aquifer under the WMM facility as the leak detection system for Tailings Cells 1, 2, and 3 (and developed a groundwater monitoring program that can detect tailings cell leakage only after waste has migrated out of these legacy impoundments).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 do not have appropriate chemical properties and sufficient strength and thickness to prevent failure due to conditions outlined in 40 C.F.R. § 264.221(a)(1).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 are not compatible with alternate feed materials contained in the impoundments.

13. Several important sections of the proposed rulemaking rely on the provisions of 40 C.F.R. § 264.221(c) (and not 40 C.F.R. § 264.221(a)) to explain protection of groundwater or other environmental analysis. *See, e.g.*, page 25393 (setting forth specific liner requirements from 40 C.F.R. § 264.221(c)); page 25397 (specifically relying on safeguards from a leak detection system); page 25401 (specifying that the proposed GACT is for double liners on non-conventional impoundments). The provisions of 40 C.F.R. § 264.221(c) are significantly more protective of groundwater, human health, and the environment.

    - Is the EPA taking the position that all conventional impoundments and non-conventional impoundments must meet the requirements of 40 C.F.R. § 264.221(c)? If so, please clarify the EPA's position on whether Tailings Cells 1, 2, and 3 at the WMM meet the requirements of 40 C.F.R. § 264.221(c).

    - If the EPA is <u>not</u> taking the position that 40 C.F.R § 264.221(c) applies to all conventional and non-conventional impoundments, please explain how the EPA addressed risks to groundwater from legacy impoundments like Tailings Cells 1,

2, and 3. Please specifically address how the EPA assessed the risk of groundwater contamination from Tailings Cell 1. *See* question 12, *supra*.

14. Please explain how (or if) the EPA's specific analysis of the WMM facility addressed the following:

- Cell 2 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
- Method 115 monitoring on Cell 2 detected a Subpart W NESHAPS violation in 2012/2013 over the 20 pCi/m2-s limit.
- Cell 3 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
- Cell 3 is currently the only tailings cell at the WMM that receives certain forms of 11(e)(2) byproduct material (materials trucked in, including ISL waste).
- The WMM facility has not historically operated its "conventional" and "non-conventional" tailings impoundments separately. Tailings Cell 4A was operated as a "non-conventional" impoundment, which resulted in surface and groundwater contamination until the cell was retrofitted starting in 2008. Tailings Cell 4B is currently operated as a "non-conventional" impoundment, but the WMM owners indicate that it will be used as a "conventional" impoundment in the future.
- Under currently approved and proposed reclamation plans for the WMM, the permanent radon barriers will not be placed on *any* tailings impoundments until final reclamation at the facility.

V. NON-CONVENTIONAL IMPOUNDMENTS

15. How did the EPA develop the proposed definition of "non-conventional impoundments"?

16. Please explain how the EPA will distinguish between conventional and non-conventional impoundments.

    a. Is there a minimum amount of liquid that must be present in the pond for the EPA to classify a tailings impoundment as a non-conventional impoundment, or can a facility owner convert a conventional impoundment into a non-conventional impoundment by adding the minimum 1m of liquid on the top of the impoundment?

    b. Will the final reclamation or removal plan for a tailings impoundment determine whether it qualifies as a "non-conventional impoundment"?

        o Please explain how the EPA will treat Tailings Cell 1 at the WMM (noting that the WMM owners plan to remove solids from the cell upon final reclamation, but then permanently dispose of debris from the Mill facilities and contaminated soil in the cell). *See* June 1, 2009 Response Letter at 6; page 25405 of the proposed rulemaking (addressing the disposal of byproduct material like deconstruction material during facility reclamation).

- Please explain how the EPA will treat Tailings Cell 4B at the WMM (which the WMM owner is currently operating as a non-conventional impoundment, but which will become a conventional impoundment before final reclamation).

17. The WMM is currently authorized to temporarily place liquid 11(e)(2) byproduct material in "Roberts Pond" (before pumping the liquid into Tailings Cells 1 and 4B). Does Roberts Pond meet the proposed definition of a "non-conventional impoundment"? *See* pages 25390, 25393 of the proposed rulemaking (addressing "holding" and "collection" ponds). Please explain how EPA has assessed the Radon-222 emissions from Roberts Pond and from the regular transfer of process water from Roberts Pond to Tailings Cells 1 and 4B.

18. Please explain the EPA's rationale for allowing non-conventional impoundments to exist until removal at facility closure.

    - Did the EPA analyze whether allowing water-covered impoundments to exist for the life of a facility increases risks of groundwater and surface water contamination? Please see question 12 (and explain EPA's position on the 15-year design life for Tailings Cell 1 at the WMM).
    - How will the EPA ensure that non-conventional impoundments are periodically retrofitted to ensure that the impoundments do not contaminate groundwater and surface water?

19. EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Please explain why this linear relationship does not also justify size restrictions on non-conventional impoundments (and please specifically address how this linear relationship will impact Radon-222 emissions when large non-conventional impoundments are dewatered and closed).

20. How has the EPA analyzed what risks non-conventional impoundments (including large non-conventional impoundments like Tailings Cell 1 at the WMM) will pose to human health and the environment when they are de-watered and decommissioned?

21. How will the proposed rule address tailings impoundments that are used as conventional and non-conventional impoundments (such as Tailings Cells 4A and 4B at the WMM)? How will the EPA "count" these cells using the 2-cell limit in the conventional impoundment work practice standard?

22. The EPA's analysis that using liquids to cover tailings cells "has been sufficient to limit the amount of radon emitted from the ponds, in many cases, to almost zero" is insufficient to demonstrate that Tailings Cell 1 at the WMM has a radon flux of "almost zero" (or even under 20 pCi/m2-s).

Based on the information and questions below, please provide the EPA's specific analysis of the calculated radon emissions from Tailings Cell 1, Tailings Cell 4B, and Roberts Pond at the WMM. Please then explain how EPA calculates the dose to the White Mesa Tribal community (considering radon emissions from Tailings Cell 1 and 4B and Roberts Pond, along with radon emissions from "conventional" impoundments 2, 3, and 4A).

a. The proposed rulemaking recognizes that covering tailings impoundments with water does not reduce radon emissions to zero. *See, e.g.*, Radon Emission from Evaporation Ponds (noting that the radon flux above some evaporation ponds can be significant/exceed 20 pCi/m2-s).
b. The proposed rulemaking contemplates the use of radium-laden "process water" to provide liquid covers on non-conventional impoundments, but does not address whether the use of radium-laden process water increases the radon emissions from a non-conventional impoundment. The EPA analysis justifying the use of the 1 meter water cover relies on the assumption that the water cover is not laden with radium. The EPA analysis also calculates significant radon flux from non-conventional impoundments containing radium-laden water. Please justify the EPA's position that 1 m of radium-laden process water can decrease radon flux from tailings impoundments like Tailings Cell 1 at WMM to zero.
c. The EPA's analysis of radon emissions from liquid-covered impoundments recognizes that there are significant radon emissions during the transfer of radium-laden waters to and between tailings impoundments and during enhanced evaporation sprays, but it does not calculate or address these emissions for conventional mills like the WMM.
d. Using the radon flux equation contained in Section 4.0 of the Radon Emissions from Evaporation Ponds report along with the actual radium content[1] in Tailings Cell 1, the Tribe's initial calculation on the radon flux from Tailings Cell 1 is 327 pCi/m2-s (not including emissions during transfer into Cell 1 or during enhanced evaporation sprays).

VI. CONVENTIONAL IMPOUNDMENTS

23. The Tribe is generally confused about the EPA's approach to Tailings Cells 2 and 3 at the WMM. The EPA seems to recognize that neither of these tailings cells meets the work practice standards proposed in this rulemaking. *See* page 25395 of the proposed rulemaking (noting that Cell 3 could not meet the work practice standards). Given that both tailings impoundments are still licensed by the Agreement State to receive liquid and solid 11(e)(2) byproduct material and that neither tailings impoundment has a tailings closure plan with milestones for placement of a permanent radon barrier, please explain how the EPA can continue to justify removing the monitoring requirements and emissions limits that currently apply to these impoundments.

[1] To determine the actual radium content, the Tribe used the 32,700 pCi/L Gross Radium Alpha concentration provided in the in the 2013 Annual Tailings Report.

24. The Tribe is concerned that, although Tailings Cell 2 had a recent violation of the 20 pCi/m2-s emissions limit that applies to existing impoundments (and although that violation was detected during monitoring conducted under Method 115), the EPA did not consider Cell 2 when considering how the proposed rulemaking would impact the WMM. Please explain why the EPA omitted any analysis of Cell 2 and the recent Subpart W violation at Cell 2. Please also explain how the EPA will ensure that emissions from Tailings Cell 2 do not exceed 20 pCi/m2-s between now and when the final radon barrier is placed during final reclamation of the entire facility (given that the EPA is proposing to eliminate both the emissions limit and the monitoring to detect Radon-222 emissions over 20 pCi/m2-s).

25. The proposed rulemaking references the use of an "interim cover" on Tailings Cells 2 and 3 at the WMM. The Tribe is concerned that the WMM owners have used this "interim cover" on Tailings Cell 2 for more than a decade (and that the use of this cover has already resulted in Radon-222 emissions of over the 20 pCi/m2-s limit) and that the Reclamation Plan for the WMM contemplates the use of such "interim covers" until final reclamation at the facility. Please explain whether and how the EPA justifies the use of interim covers (and not the immediate placement of permanent radon barriers).

VII. APPLICABILITY OF 40 C.F.R. PART 192

26. A significant portion of the EPA's analysis in the proposed rulemaking (including analysis on impacts to the environment and human health, analysis on weather and other hazards, and economic analysis) rests on the assumption that all tailings impoundments (conventional and non-conventional) meet the standards set forth in 40 C.F.R. § 192.32(a)(1) and 40 C.F.R. § 264.221. How will the EPA ensure that all the tailings impoundments at the WMM facility meet the applicable federal standards?

27. The EPA is proposing to eliminate internal cross references to the sections of 40 C.F.R. Part 192 that cover placement of permanent radon barriers on tailings impoundments. Additionally, although the EPA identified the need to better define "closure" under Subpart W, the revisions to the terms "standby" and "operation" in the proposed rulemaking do not define or address "closure" under the revised Subpart W NESHAP regulations.
    - How will the EPA determine whether a tailings impoundment has entered "final closure" for Subpart W NESHAP purposes?
    - If the EPA no longer intends to utilize other portions of 40 C.F.R. Part 192 (including, but not limited to, the definitions of "Tailings Closure Plan," "Permanent Radon Barrier," and requirements that the permanent radon barrier be constructed as expeditiously as possible and in accordance with a tailings closure plan), how will the EPA ensure that permanent radon barriers are properly placed on tailings cells? Here, please address the Tribe's concern that, under current reclamation plans for the WMM, the permanent radon barriers for Cells 2 and 3 will not be placed under final reclamation of the facility (and that there are no Tailings Closure Plans, as defined in 40 C.F.R. Part 192, with milestones for the expeditious placement of the permanent radon barriers).

28. The Tribe is concerned that the Tribal community in White Mesa will be exposed to elevated levels of Radon-222 when the WMM facility undertakes de-watering or other closure activities or allows Tailings Cells 2 and 3 to remain open under an “interim cover.” Please explain how the EPA has specifically assessed the anticipated dose to the White Mesa Community *during* the closure period. Please also explain how the EPA will ensure that Tribal members, Tribal lands and other Indian Trust Assets are not exposed to Radon-222 emissions in excess of 20 pCi/m2-s during the closure period.

To: Sutin, Elyana
Cc: Rothery, Deirdre; Jackson, Scott
Subject: RE: Save the Date: Subpart W Public Hearing

Wow, that's exciting! Thank you.

Let's plan on having Dee and/or Scott trained too as a backup. Let me know the best way to get that scheduled, and how much time is needed.

Thanks again,
Angelique

Angelique D. Diaz, Ph.D.
Environmental Engineer
Air Program, USEPA/Region 8
1595 Wynkoop Street (8P-AR)
Denver, CO 80202-1129

-----Original Appointment-----
From: Sutin, Elyana
Sent: Monday, June 23, 2014 11:12 AM
To: Diaz, Angelique
Subject: Accepted: Save the Date: Subpart W Public Hearing
When: Occurs every day effective 9/3/2014 until 9/4/2014 from 8:00 AM to 5:00 PM (UTC-07:00) Mountain Time (US & Canada).
Where: EPA Conference Center

Angelique-

I am returning from taking my daughter to college on the East Coast on 9/2. Assuming there are no flight issues, I am available on the 3rd and 4th.

Thanks,

Elyana

I believe so (all my notes are packed for an impending move). I was there, along with Jonathan Edwards. I don't have Region 8 attendance but I copied Angelique Diaz who may have their attendees.

Hi Marissa,

Hmmm. There wasn't a sign-in sheet but I've got some notes from the meeting. These are the folks that I have, maybe Pat can help me identify the folks from OAR. Sorry I can't be more helpful.

EPA:
Jane Nishida (OITA/IO)
Karin Koslow (OITA/AIEO)
Janice Sims (OSWER/IO)
Danny Gogal (OECA/OEJ)
Dana Stalcup (OSWER/OSRTI)
Lee Tyner (OGC)

OAR (sorry didn't record names)
Region 8 was on the phone…. I have in my notes a "Chris/Christine" sorry- didn't get a last name though I distinctly remember more than one R8 person on the phone.

Hi Janice!

Great seeing last Friday!

I'm responding to a question from Karin regarding a meeting we had with the Ute Tribal Chair back on March 13th. I have the scheduler with the list of attendees, but do you have an actual list of who was in the room? Scott Clough is asking for it.

Thanks in advance!

It has come to my attention that a court reporter is needed for the Subpart W public hearing. Let me know what kind of help you need from Region 8 in identifying one. I am told that for previous hearings HQ provided the money and the Region found the reporter.

Thanks,
Angelique

Tony,

Correct me if I'm wrong, but didn't you cost a court reporter in your work assignment request? It really doesn't matter to me, if the Region can get a good deal then we should go with it.

National Tribal Air Association
NTAA- EPA Air Policy Call Agenda
June 26th, 2014

Call In Number: 1-866-299-3188
Conference Code: 9195415624#

Call Time: 10 am AK, 11 am PT, 12 pm MT, 1 pm CT, and 2 pm ET

GotoWebinar page to view documents on the call:
https://attendee.gotowebinar.com/register/3207916791458128641

Call Agenda:

1. **EPA's Proposed Clean Power Plan: Presented by Janet McCabe**, OAR – 30 minutes.

   On June 2, 2014, the EPA proposed the Clean Power Plan that will maintain an affordable, reliable energy system, while cutting pollution and protecting our health and environment. Power plants are the largest source of carbon pollution in the U.S., accounting for roughly one-third of all domestic greenhouse gas emissions. Nationwide, the Clean Power Plan will help cut carbon pollution from the power sector by 30 percent below 2005 levels. EPA's Acting Assistant Administrator Janet McCabe will be on the call to present the Clean Power Plan and answer any questions for those on the call. The draft Clean Power Plan can be found here: http://www2.epa.gov/carbon-pollution-standards.

2. **EPA's Proposed Rule for Radon Emissions from Uranium mills: Presented by Reid Rosnick**, ORIA - Time: 30 minutes.

   On May 2nd, EPA proposed a rule which would revise Subpart W of 40 CFR Part 61, "*National Emission Standards for Operating Uranium Mill Tailings.*" The presentation will review the main points of the proposed rule with time for questions and answers. The draft rule can be found here:

http://www.epa.gov/radiation/docs/neshaps/subpart-w/neshap_subpart-w_npr-final_-prepublication.pdf

3. **EPA Air Updates – (OAR, OAQPS, OTAQ, ORIA, OAP)**

4. **NTAA Updates – Bill Thompson, NTAA Chairman**

The next NTAA/EPA Policy call will be on
July 31st, 2014 at 12:00 Noon Mountain Time

Subject: EPA Call agenda

Here is the agenda for the call on the 26th. I am sorry I will not be able to hear your presentation but am thankful that Cristina can fill in as the facilitator.

If you have further questions about the agenda or to finalize plans on your presentation, please contact Cristina who I have cc'ed here.

Cristina's office phone is 928-523-8785.

We look forward to receiving your presentation.

Andy

Dear Mr. Rosnick and Mr. Nesky,

I have attached a letter to EPA on behalf of 13 organizations requesting hearings in the Subpart W Rulemaking, Docket ID No. EPA-HQ-OAR-2008-0218.

We appreciate in advance for your consideration and look forward to your response. Please contact me if you have any questions or would like additional information.

Subject: Feedback on hearing registration website; planning of new Task Order for September

Dear Mary:

Congratulations on your new contract! I am looking forward to working with SRA this September. I'd like to get the ball rolling on a new Task Order for the September hearings. Could you please give me a call at your earliest convenience to discuss scope?

Here is some feedback on the registration website:

- Description: Please change the first sentence to read: "National Emission Standards for Radon Emissions from Operating Uranium Mill Tailings," Subpart W of 40 CFR Part 61 sets limits on radon emissions from tailings at operating uranium mills.
- Dates and capacity. The hearing dates are now 9/3/14 and 9/4/14. The 9/3 reservation holds 100 and the 9/4 holds 60 people.
- Contact: Would it be possible to make me the contact person for the hearing?

Re: Request for Public Hearings, Docket ID No. EPA-HQ-OAR-2008-0218

Dear Mr. Rosnick and Mr. Nesky,

We would like to express our appreciation to the Environmental Protection Agency for initiating the Rulemaking for Revisions to the National Emission Standards for Radon Emissions from Operating Mill Tailings, known as NESHAPs Subpart W. This process can provide an excellent opportunity for public involvement and citizen-driven decision-making. The members and supporters of our organizations share a collective interest in ensuring that the new Subpart W rule provides the highest level of protective measures for human health and the environment and that an appropriate regulation is developed to limit radiation emissions from uranium recovery facilities across the United States.

As such, members of our organizations are eager to attend and participate in public hearings and respectfully request that EPA hold multiple proceedings in affected communities in order to enable a more robust and participatory decision-making process. Due to the lengthy travel distances in the West, holding hearings in multiple locations is warranted because the new rule will have bearing on facilities in each respective region. EPA is also obligated to consider Environmental Justice issues in the development of the new Subpart W rule. Many of the affected communities near uranium recovery facilities include residents who are members of indigenous groups, whose interests must be considered and whose interests must be addressed. In all communities affected by uranium recovery facilities, Environmental Justice issues are also linked to economic disparities, which must be carefully weighed and considered. Having multiple hearings will increase the ability of affected community members to participate directly in the public review process and address these issues.

Therefore, we request that EPA hold hearings in the following locations during the public comment period:

- White Mesa, Utah
- Cañon City, Colorado
- Gallup, New Mexico
- Rapid City, South Dakota

The community of White Mesa, Utah, is home to the only operating conventional uranium mill in the nation and is currently subject to Subpart W regulation. The operation of the mill and its history of noncompliance with EPA and State of Utah regulations, including Subpart W, have been controversial and have resulted in litigation against the operator that addresses the violation of Subpart W requirements and the operations of the subject tailing ponds. Nearby residents have experienced the impacts of offsite contamination and radioactive releases from the White Mesa Mill, as documented in a peer-reviewed study issued by the U.S. Geological Survey in 2011. The future Piñon Ridge Mill in Colorado is also within reachable distance of White Mesa. Members of the public expressed great dissatisfaction with the Subpart W permitting of this mill, which largely exempted monitoring requirements to help prevent radioactive releases. It is essential for EPA to conduct a hearing in White Mesa and take input from people who live in the region.

Residents of Cañon City, Colorado, and the surrounding region have an interest in ongoing EPA oversight of the Cotter Corporation mill at Lincoln Park, which is currently undergoing final closure but is subject to Subpart W compliance because of the continuing deposition of material into regulated tailings ponds. Community members are directly affected by the mill's history of radioactive releases and years-long issues with the implementation of monitoring required under Subpart W. In addition, surrounding areas are also affected by future uranium recovery proposals that involve developing technologies that are likely to be classified for regulation requiring NRC licensing and EPA oversight for Subpart W implementation.

Gallup, New Mexico, is the city nearest to the first proposed in-situ recovery uranium mine in New Mexico. Gallup is a central location, accessible for multiple communities on Navajo Nation and the Pueblos of Acoma, Laguna and Zuni, which are affected by the possibility of future regulated facilities in Northwestern New Mexico and on Mount Taylor. Existing reclamation and closure projects near Milan and Churchrock operate evaporation ponds that emit radon into surrounding communities. There are proposals for conventional uranium mining and processing facilities around Mount Taylor. Affected communities in the region have a direct interest in implementation of

Subpart W due to its implications for radon releases from: 1) in-situ recovery mining, and 2) two evaporation ponds that are currently in place on top of the Churchrock uranium mill tailings pile. Residents throughout the region are also concerned about the impacts to tribal lands, jurisdictions and traditional use areas, most notably the state-designated Mt. Taylor Traditional Cultural Property as it pertains to Subpart W. A public hearing in Gallup will help EPA to take direct input from affected residents in the interest of fully addressing Environmental Justice concerns as part of the Subpart W rulemaking process.

Rapid City, South Dakota, is a central location to take input from members of the public affected by the proposed Dewy-Burdock in-situ mine, sited on traditional lands of the Oglala Sioux Tribe, which has raised significant issues about the impacts of radiation releases and contamination of important cultural areas. Members of the public who are affected by the Crow Butte facility in Chadron, Nebraska — which has a lengthy history of radioactive releases — as well as by uranium recovery facilities in northeast Wyoming will also receive the benefit of participation in a hearing in a regional location. Residents in the region are affected by the increasing number of proposals and expansions planned for in-situ recovery facilities in the Northern Plains and would enjoy an increased opportunity to participate through a hearing in Rapid City.

Thank you for considering our request to hold multiple hearings in affected communities for the Subpart W Rulemaking. If you have any questions regarding this correspondence, please do not hesitate to contact any of our organizations.

Sincerely,

Subject: RE: March 13 meeting with Ute tribal chair

Hi Marissa,

Hmmm. There wasn't a sign-in sheet but I've got some notes from the meeting. These are the folks that I have, maybe Pat can help me identify the folks from OAR. Sorry I can't be more helpful.

EPA:
Jane Nishida (OITA/IO)
Karin Koslow (OITA/AIEO)
Janice Sims (OSWER/IO)
Danny Gogal (OECA/OEJ)
Dana Stalcup (OSWER/OSRTI)
Lee Tyner (OGC)

OAR (sorry didn't record names)
Region 8 was on the phone…. I have in my notes a "Chris/Christine" sorry- didn't get a last name though I distinctly remember more than one R8 person on the phone.

Hi Janice!

Great seeing last Friday!

I'm responding to a question from Karin regarding a meeting we had with the Ute Tribal Chair back on March 13th. I have the scheduler with the list of attendees, but do you have an actual list of who was in the room? Scott Clough is asking for it.

Thanks in advance!

UTE MOUNTAIN UTE TRIBE'S INITIAL QUESTIONS
Environmental Protection Agency, Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings, Proposed Rule
40 C.F.R. Part 61
Submitted on June 13, 2014 in preparation for government-to-government consultation, July 10, 2014

I. EPA, INDIAN TRIBES, AND EXECUTIVE ORDER 13175

1. The Environmental Protection Agency's (EPA) statement regarding compliance with Executive Order 13175 states that the Subpart W rulemaking action does not have "tribal implications" because the rulemaking does not impose regulatory requirements on tribal governments. Please be prepared to discuss how the following issues impact the EPA's Executive Order 13175 analysis:

   - Although Native Americans make up only 1.4 percent of Utah's racial profile (and 0.9 percent of the United States' racial profile), they make up 55.8 percent of the racial profile for San Juan County, Utah (the county where the White Mesa Mill (WMM) is located).
   - The WMM facility is located on aboriginal lands of the Ute Mountain Ute Tribe.
   - The WMM facility is located adjacent to land and other Indian Trust Assets held in trust by the United States on behalf of the Ute Mountain Ute Tribe (and less than 3 miles from the nearest Tribal resident).
   - The Tribal community located in White Mesa is downgradient of the WMM facility.
   - The Tribal community located in White Mesa is completely dependent on groundwater supplies located underneath the WMM facility and tailings cells.
   - Activities and operations at the WMM have already impacted Tribal members' abilities to use surface, plant, wildlife, and surface water resources on public and Tribal lands.

2. Please be prepared to discuss how the EPA will address Tribal concerns during this Subpart W rulemaking and related rulemaking processes (including, but not limited to, the anticipated revision to 40 C.F.R. Part 192).

3. Please be prepared to discuss how or whether the EPA undertook analysis of how this rulemaking will impact UMU Tribal members, UMU Tribal lands, and Indian Trust Assets.

II. NESHAPS/CLEAN AIR ACT QUESTIONS

4. Has the EPA evaluated establishing a lesser quantity or different criteria for major sources of radionuclides under Section 112(a)(1) of the CAA? *See* footnote 2, page 25390 of the proposed rulemaking (noting that *none* of the uranium recovery facilities are major sources under NESHAPS).

5. On page 25390 of the proposed rulemaking, the EPA identifies the "source category" for Subpart W using 40 C.F.R. § 61.250 and the proposed definition of "uranium recovery facility." Has the EPA listed uranium recovery facilities as a category or subcategory of sources under Section 112(c) of the Clean Air Act? If so, please provide an explanation and documentation in advance of the consultation meeting.

6. On page 25390 of the proposed rulemaking, the EPA states, "Subpart W requirements specifically apply to the affected sources at the uranium recovery facilities that are used to manage or contain the uranium byproduct material or tailings." However, the proposed Subpart W rulemaking only covers some HAP sources at uranium recovery facilities, and not others (such as stackhouses, ore pad, ore grinder, and the Mill yard, see Question 7, *infra*). Please explain the EPA's rationale for excluding such HAP sources at conventional uranium mills.

7. On page 25390 of the proposed rulemaking, the EPA states: "We presently have no data or information that shows any other HAPs being emitted from these impoundments." Please provide a response to the following initial questions, data, and information regarding other HAPs that may be emitted from the WMM.

    - The WMM's 10 C.F.R. § 40.65 environmental airborne particulate monitoring program monitors for natural uranium (Uranium-238, Uranium-234, Uranium-235), Thorium-230, Radium-226, and Lead-210. This air monitoring program has detected all four isotopes at all of the air monitoring stations. Additionally, the WMM has identified Lead-210, Thorium-230, Thorium-232, Polonium-210, Radium-226, and Radium-228 in wastewater samples from the tailings impoundments. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
    - The WMM processes uranium ore. During the uranium storage and milling processes, there may be more than three dozen radioactive isotopes present at the WMM facility (including actinium, astatine, bismuth, francium, lead, polonium, protactinium, radium, radon, thallium, thorium, and uranium). *See* Uranium Decay Series diagram on page 44 of the Technical and Regulatory Support document. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
    - The WMM's uranium milling process uses significant quantities of chemicals (sodium chlorate is used during ore oxidation; sulfuric acid and flocculants are used during the leaching and clarification; secondary amines/kerosene, tri-alkyl amines/tributyl phosphate modifier, and quaternary ammonium compounds/alcohol are used during the solvent extraction; chlorides and sulfates are used during pregnant liquor stripping; and ammonia hydroxide and sodium hydroxide during yellowcake precipitation). During the storage and use of these chemicals, and after these chemicals are disposed in the tailings impoundments, there may be significant emissions of HAPs at the WMM.

- The WMM processes alternate feed materials. During the alternate feed storage and milling processes, other radioactive isotopes, non-metal compounds, and other regulated HAPs may be emitted from the WMM.
- The WMM processes vanadium ore. Vanadium is considered to be dangerous to life and health by both the Occupational Safety and Health Administration and the National Institute for Occupational Safety and Health, and may be listed as a HAP in the future. The WMM's vanadium recovery process uses a significant quantity of chemicals (sodium chlorate is used during the redox/pH adjustment; kerosene and secondary amines are used during the solvent extraction; soda ash is used during the vanadium pregnant liquor stripping process; and ammonia hydroxide is used during the vanadium precipitation). This indicates that the vanadium recovery process results in the emission of HAPs other than Radon-222 from the WMM facility.

8. On page 25390 of the proposed rulemaking, the EPA states that it evaluated the MACT standards applicable to major sources in the same industrial sector. Please provide the Tribe with this analysis prior to the consultation, and be prepared to explain the MACT analysis that the EPA performed during this rulemaking process.

9. Please explain how the EPA evaluated the use of a work practice standard, rather than an emissions standard, for the control of a HAP under the proposed rulemaking. *See* Section 112(h), Clean Air Act. Please specifically address the EPA's determination to remove the current emissions standard for existing impoundments. Please also explain how removing the emissions standard from Subpart W will affect: (a) how the WMM facility sets and meets the ALARA goal to protect worker and adjacent communities from radionuclides; and (b) monitoring of radon emissions under 10 C.F.R. Part 40, Appendix A.

III. SUBPART W AND CLOSURE OF LEGACY IMPOUNDMENTS

10. In 1989, when the EPA proposed the current Subpart W NESHAP, the EPA concluded that, "Existing mill tailing piles are large piles of waste that emit radon. There is nothing that can be done to reduce the amount of radon they emit except cover them." 54 FR 9644 (March 7, 1989). EPA crafted Subpart W to prohibit uranium mills from having more than two tailings impoundments in operation. Explain why the EPA has not required closure of the legacy Tailings Cells 1, 2, and 3 at the WMM, as contemplated and required by the current NESHAP.

11. In this proposed rulemaking, the EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Explain how the EPA can justify the long-term risk of having almost 300 acres of tailings impoundments that are either in operation or in closure but without a permanent radon barrier at the WMM. *See also* questions on conventional and non-conventional impoundments.

IV. DEFICIENT OR INCORRECT ANALYSIS OF OPERATIONS AND FACILITIES AT THE WMM

12. The owners of the WMM state in the June 1, 2009 letter response to EPA's CAA Section 114 Information Request that Tailings Cells 1, 2, and 3 meet the requirements of 40 C.F.R. 192.32(a). The WMM owners specify that these specific Tailings Cells meet the design and operating requirements under 40 C.F.R. 264.221(a). Please explain how the EPA evaluated the WMM owners' assertions regarding compliance with 40 C.F.R. 192.32(a) and 40 C.F.R. 264.221(a), given the following:
    - The liners in Tailings Cells 1, 2, and 3 were designed for a 15-year life and were installed between May 1980 and September 1982. These impoundments have already been in operation for over 30 years.
    - Contamination of the shallow groundwater underlying Tailings Cells 1, 2, and 3 has been documented and is the subject of investigation and corrective action to address elevated chloroform, nitrate and chlorides. There is significant evidence that the liners on Tailings Cells 1, 2, and 3 have already allowed migration of waste out of the impoundments into the adjacent groundwater.
    - The Agreement State and the WMM owners treat the shallow groundwater aquifer under the WMM facility as the leak detection system for Tailings Cells 1, 2, and 3 (and developed a groundwater monitoring program that can detect tailings cell leakage only after waste has migrated out of these legacy impoundments).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 do not have appropriate chemical properties and sufficient strength and thickness to prevent failure due to conditions outlined in 40 C.F.R. § 264.221(a)(1).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 are not compatible with alternate feed materials contained in the impoundments.

13. Several important sections of the proposed rulemaking rely on the provisions of 40 C.F.R. § 264.221(c) (and not 40 C.F.R. § 264.221(a)) to explain protection of groundwater or other environmental analysis. *See, e.g.*, page 25393 (setting forth specific liner requirements from 40 C.F.R. § 264.221(c)); page 25397 (specifically relying on safeguards from a leak detection system); page 25401 (specifying that the proposed GACT is for double liners on non-conventional impoundments). The provisions of 40 C.F.R. § 264.221(c) are significantly more protective of groundwater, human health, and the environment.

    - Is the EPA taking the position that all conventional impoundments and non-conventional impoundments must meet the requirements of 40 C.F.R. § 264.221(c)? If so, please clarify the EPA's position on whether Tailings Cells 1, 2, and 3 at the WMM meet the requirements of 40 C.F.R. § 264.221(c).

    - If the EPA is <u>not</u> taking the position that 40 C.F.R § 264.221(c) applies to all conventional and non-conventional impoundments, please explain how the EPA addressed risks to groundwater from legacy impoundments like Tailings Cells 1,

2, and 3. Please specifically address how the EPA assessed the risk of groundwater contamination from Tailings Cell 1. *See* question 12, *supra*.

14. Please explain how (or if) the EPA's specific analysis of the WMM facility addressed the following:

- Cell 2 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
- Method 115 monitoring on Cell 2 detected a Subpart W NESHAPS violation in 2012/2013 over the 20 pCi/m2-s limit.
- Cell 3 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
- Cell 3 is currently the only tailings cell at the WMM that receives certain forms of 11(e)(2) byproduct material (materials trucked in, including ISL waste).
- The WMM facility has not historically operated its "conventional" and "non-conventional" tailings impoundments separately. Tailings Cell 4A was operated as a "non-conventional" impoundment, which resulted in surface and groundwater contamination until the cell was retrofitted starting in 2008. Tailings Cell 4B is currently operated as a "non-conventional" impoundment, but the WMM owners indicate that it will be used as a "conventional" impoundment in the future.
- Under currently approved and proposed reclamation plans for the WMM, the permanent radon barriers will not be placed on *any* tailings impoundments until final reclamation at the facility.

V. NON-CONVENTIONAL IMPOUNDMENTS

15. How did the EPA develop the proposed definition of "non-conventional impoundments"?

16. Please explain how the EPA will distinguish between conventional and non-conventional impoundments.

    a. Is there a minimum amount of liquid that must be present in the pond for the EPA to classify a tailings impoundment as a non-conventional impoundment, or can a facility owner convert a conventional impoundment into a non-conventional impoundment by adding the minimum 1m of liquid on the top of the impoundment?

    b. Will the final reclamation or removal plan for a tailings impoundment determine whether it qualifies as a "non-conventional impoundment"?

        - Please explain how the EPA will treat Tailings Cell 1 at the WMM (noting that the WMM owners plan to remove solids from the cell upon final reclamation, but then permanently dispose of debris from the Mill facilities and contaminated soil in the cell). *See* June 1, 2009 Response Letter at 6; page 25405 of the proposed rulemaking (addressing the disposal of byproduct material like deconstruction material during facility reclamation).

- Please explain how the EPA will treat Tailings Cell 4B at the WMM (which the WMM owner is currently operating as a non-conventional impoundment, but which will become a conventional impoundment before final reclamation).

17. The WMM is currently authorized to temporarily place liquid 11(e)(2) byproduct material in “Roberts Pond” (before pumping the liquid into Tailings Cells 1 and 4B). Does Roberts Pond meet the proposed definition of a “non-conventional impoundment”? *See* pages 25390, 25393 of the proposed rulemaking (addressing “holding” and “collection” ponds). Please explain how EPA has assessed the Radon-222 emissions from Roberts Pond and from the regular transfer of process water from Roberts Pond to Tailings Cells 1 and 4B.

18. Please explain the EPA’s rationale for allowing non-conventional impoundments to exist until removal at facility closure.

    - Did the EPA analyze whether allowing water-covered impoundments to exist for the life of a facility increases risks of groundwater and surface water contamination? Please see question 12 (and explain EPA’s position on the 15-year design life for Tailings Cell 1 at the WMM).
    - How will the EPA ensure that non-conventional impoundments are periodically retrofitted to ensure that the impoundments do not contaminate groundwater and surface water?

19. EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Please explain why this linear relationship does not also justify size restrictions on non-conventional impoundments (and please specifically address how this linear relationship will impact Radon-222 emissions when large non-conventional impoundments are dewatered and closed).

20. How has the EPA analyzed what risks non-conventional impoundments (including large non-conventional impoundments like Tailings Cell 1 at the WMM) will pose to human health and the environment when they are de-watered and decommissioned?

21. How will the proposed rule address tailings impoundments that are used as conventional and non-conventional impoundments (such as Tailings Cells 4A and 4B at the WMM)? How will the EPA “count” these cells using the 2-cell limit in the conventional impoundment work practice standard?

22. The EPA’s analysis that using liquids to cover tailings cells “has been sufficient to limit the amount of radon emitted from the ponds, in many cases, to almost zero” is insufficient to demonstrate that Tailings Cell 1 at the WMM has a radon flux of “almost zero” (or even under 20 pCi/m2-s).

Based on the information and questions below, please provide the EPA's specific analysis of the calculated radon emissions from Tailings Cell 1, Tailings Cell 4B, and Roberts Pond at the WMM. Please then explain how EPA calculates the dose to the White Mesa Tribal community (considering radon emissions from Tailings Cell 1 and 4B and Roberts Pond, along with radon emissions from "conventional" impoundments 2, 3, and 4A).

a. The proposed rulemaking recognizes that covering tailings impoundments with water does not reduce radon emissions to zero. *See, e.g.*, Radon Emission from Evaporation Ponds (noting that the radon flux above some evaporation ponds can be significant/exceed 20 pCi/m2-s).
b. The proposed rulemaking contemplates the use of radium-laden "process water" to provide liquid covers on non-conventional impoundments, but does not address whether the use of radium-laden process water increases the radon emissions from a non-conventional impoundment. The EPA analysis justifying the use of the 1 meter water cover relies on the assumption that the water cover is not laden with radium. The EPA analysis also calculates significant radon flux from non-conventional impoundments containing radium-laden water. Please justify the EPA's position that 1 m of radium-laden process water can decrease radon flux from tailings impoundments like Tailings Cell 1 at WMM to zero.
c. The EPA's analysis of radon emissions from liquid-covered impoundments recognizes that there are significant radon emissions during the transfer of radium-laden waters to and between tailings impoundments and during enhanced evaporation sprays, but it does not calculate or address these emissions for conventional mills like the WMM.
d. Using the radon flux equation contained in Section 4.0 of the Radon Emissions from Evaporation Ponds report along with the actual radium content[1] in Tailings Cell 1, the Tribe's initial calculation on the radon flux from Tailings Cell 1 is 327 pCi/m2-s (not including emissions during transfer into Cell 1 or during enhanced evaporation sprays).

VI. CONVENTIONAL IMPOUNDMENTS

23. The Tribe is generally confused about the EPA's approach to Tailings Cells 2 and 3 at the WMM. The EPA seems to recognize that neither of these tailings cells meets the work practice standards proposed in this rulemaking. *See* page 25395 of the proposed rulemaking (noting that Cell 3 could not meet the work practice standards). Given that both tailings impoundments are still licensed by the Agreement State to receive liquid and solid 11(e)(2) byproduct material and that neither tailings impoundment has a tailings closure plan with milestones for placement of a permanent radon barrier, please explain how the EPA can continue to justify removing the monitoring requirements and emissions limits that currently apply to these impoundments.

[1] To determine the actual radium content, the Tribe used the 32,700 pCi/L Gross Radium Alpha concentration provided in the in the 2013 Annual Tailings Report.

24. The Tribe is concerned that, although Tailings Cell 2 had a recent violation of the 20 pCi/m2-s emissions limit that applies to existing impoundments (and although that violation was detected during monitoring conducted under Method 115), the EPA did not consider Cell 2 when considering how the proposed rulemaking would impact the WMM. Please explain why the EPA omitted any analysis of Cell 2 and the recent Subpart W violation at Cell 2. Please also explain how the EPA will ensure that emissions from Tailings Cell 2 do not exceed 20 pCi/m2-s between now and when the final radon barrier is placed during final reclamation of the entire facility (given that the EPA is proposing to eliminate both the emissions limit and the monitoring to detect Radon-222 emissions over 20 pCi/m2-s).

25. The proposed rulemaking references the use of an "interim cover" on Tailings Cells 2 and 3 at the WMM. The Tribe is concerned that the WMM owners have used this "interim cover" on Tailings Cell 2 for more than a decade (and that the use of this cover has already resulted in Radon-222 emissions of over the 20 pCi/m2-s limit) and that the Reclamation Plan for the WMM contemplates the use of such "interim covers" until final reclamation at the facility. Please explain whether and how the EPA justifies the use of interim covers (and not the immediate placement of permanent radon barriers).

VII. APPLICABILITY OF 40 C.F.R. PART 192

26. A significant portion of the EPA's analysis in the proposed rulemaking (including analysis on impacts to the environment and human health, analysis on weather and other hazards, and economic analysis) rests on the assumption that all tailings impoundments (conventional and non-conventional) meet the standards set forth in 40 C.F.R. § 192.32(a)(1) and 40 C.F.R. § 264.221. How will the EPA ensure that all the tailings impoundments at the WMM facility meet the applicable federal standards?

27. The EPA is proposing to eliminate internal cross references to the sections of 40 C.F.R. Part 192 that cover placement of permanent radon barriers on tailings impoundments. Additionally, although the EPA identified the need to better define "closure" under Subpart W, the revisions to the terms "standby" and "operation" in the proposed rulemaking do not define or address "closure" under the revised Subpart W NESHAP regulations.
    - How will the EPA determine whether a tailings impoundment has entered "final closure" for Subpart W NESHAP purposes?
    - If the EPA no longer intends to utilize other portions of 40 C.F.R. Part 192 (including, but not limited to, the definitions of "Tailings Closure Plan," "Permanent Radon Barrier," and requirements that the permanent radon barrier be constructed as expeditiously as possible and in accordance with a tailings closure plan), how will the EPA ensure that permanent radon barriers are properly placed on tailings cells? Here, please address the Tribe's concern that, under current reclamation plans for the WMM, the permanent radon barriers for Cells 2 and 3 will not be placed under final reclamation of the facility (and that there are no Tailings Closure Plans, as defined in 40 C.F.R. Part 192, with milestones for the expeditious placement of the permanent radon barriers).

28. The Tribe is concerned that the Tribal community in White Mesa will be exposed to elevated levels of Radon-222 when the WMM facility undertakes de-watering or other closure activities or allows Tailings Cells 2 and 3 to remain open under an "interim cover." Please explain how the EPA has specifically assessed the anticipated dose to the White Mesa Community *during* the closure period. Please also explain how the EPA will ensure that Tribal members, Tribal lands and other Indian Trust Assets are not exposed to Radon-222 emissions in excess of 20 pCi/m2-s during the closure period.

Hey Janice,

Here are the questions we received. Our office will be on the phone with the RA being there in person.

I am including Reid Rosnick, who is the programmatic lead o the meeting.

Subject: Ute Mtn Ute tribal consultation on July 10th

Hi Pat,

As you know (because you mentioned in one of your updates at a recent TPM meeting) that EPA is consulting with Ute Mountain Ute (UMU) on NESHAP Subpart W mainly because of the proposed changes to the national emission standard for Radon emissions for operating a uranium mill tailings. Scott Clow, UMU Environmental Director was at the most recent NTC meeting and reminded me of discussions that his Tribal Chair (Scott was there too) had with EPA HQ (OAR and OSWER/OSRTI-superfund) on March 11, 2014 concerning NESHAP and the White Mesa Uranium Mill Site (CERCLA off-site rule). The tribe has some specific questions regarding the Off-Site Rule and wanted EPA to follow-up. Scott indicated in a conversation with me after one of the NTC meetings that the July 10th consultation that is focused on NESHAP Subpart W could expand into a larger conversation with EPA to include the Off-Site Rule. The off-site rule is coordinated by two offices in OSWER (ORCR- RCRA and OSRTI- Superfund). The Superfund program is working with the RCRA program to put together an email to the Superfund DD in R8 to give him a heads up that this issue may present itself during the NESHAP consultation. This is just an FYI for you.

We understand the tribe will have consultation with the Region 10 RA on July 10th. I don't know whether or not HQ OAR will be participating. Do you know who is planning to participate from EPA?

Please let me know if you have questions.

Thanks,
Janice

RE: Request for Extension of the Public Comment Period for the Subpart W NESHAP Rulemaking (to Accommodate Government-to-Government Consultation between EPA and the Ute Mountain Ute Tribe).

Dear Administrator McCarthy:

On April 14, 2014, I sent you a letter requesting government-to-government consultation between the Environmental Protection Agency (EPA) and the Ute Mountain Ute Tribe (Tribe) on the proposed 40 C.F.R. Part 61 Revisions to National Emissions Standards for Radon Emissions from Operating Mill Tailings (Subpart W NESHAP) rulemaking. *See* Attachment 1. The EPA did not respond to this consultation request before publishing the proposed Subpart W NESHAP rulemaking in the Federal Register and setting July 31, 2014 as the final date for submitting public comments on the proposed rulemaking. Staff from the EPA have now agreed to hold a government-to-government consultation meeting with the Tribe on July 10, 2014, and Tribal staff has diligently prepared staff-to-staff questions to facilitate specific and substantive discussions on the proposed rulemaking. *See* Attachment 2.

I am writing today to request that you extend the public comment period on the Subpart W NESHAP rulemaking for an additional 90 days. This request is based on the complexity of issues contained in the proposed rulemaking and Attachment 2, the extensive nature of the underlying technical support documents, and the specific complexity of evaluating a revision of a NESHAP rule that was adopted prior to the 1990 Clean Air Act Amendments. This request is also based on a specific request that you allow the Tribe a reasonable time period after the initial

July 10, 2014 government-to-government consultation meeting to perform follow-up research, hold additional consultation meetings, and submit official public comments.

Please contact Scott Clow, Environmental Programs Department Director, at (970) 564-5432 or sclow@utemountain.org or Celene Hawkins, Associate General Counsel, at (970) 564-5642 or chawkins@utemountain.org with any questions about this extension request.

Sincerely,

Manuel Heart

RE: Government-to-Government Consultation between EPA and the Ute Mountain Ute Tribe

Dear Administrator McCarthy:

On March 13 and 17, 2014, the Ute Mountain Ute Tribe ("Tribe") met with officials in the Environmental Protection Agency's (EPA) headquarters and Region 8 offices regarding the Tribe's concerns about federal regulatory actions and decisions regarding the White Mesa Mill (a uranium mill located in southeastern Utah and approximately three miles from the Tribal community in White Mesa). I appreciate the time we spent with your agency discussing the Tribe's concerns on the two federal regulatory issues contained in the attached briefing papers (which we provided the EPA prior to the March 2014 meetings).

I would like to reiterate the specific, bulleted requests contained in the attached briefing papers. In particular, I reiterate the Tribe's request that the EPA consult with the Tribe about the proposed Subpart W NESHAP rulemaking early enough in the process that the Tribe can give meaningful and effective input prior to publishing the proposed rule for public comment.

Please contact Scott Clow, Environmental Programs Department Director, at (970) 564-5432 or sclow@utemountain.org or Celene Hawkins, Associate General Counsel, at (970) 564-5642 or chawkins@utemountain.org to set the dates where we can meet to discuss our concerns regarding the White Mesa Mill. I am certain that, by working together, we can do what is right for the people of White Mesa and the surrounding communities.

Sincerely,

Manuel Heart

ISSUE SUMMARY
ENVIRONMENTAL PROTECTION AGENCY'S ROLE IN AUTHORIZATION OF NEW SOURCES OF ALTERNATE FEED MATERIAL AT THE WHITE MESA MILL, UTAH

The White Mesa Mill ("WMM"), a uranium processing mill located in southeastern Utah and adjacent to the Ute Mountain Ute Tribe's ("Tribe") White Mesa community, is currently licensed by the State of Utah under the Atomic Energy Act, 42 U.S.C. § 2011 *et seq*. Under its current Radioactive Materials License, the WMM is licensed to receive and process both ore and alternate feed material from specific, approved CERCLA and FUSRAP sites. The WMM currently processes alternate feed material from approved sites, and the WMM also has two pending requests with the State of Utah to add new alternate feed sources to its Radioactive Materials License. The United States Environmental Protection Agency ("EPA") plays an important role in determining whether a facility like the WMM can continue to process alternate feed material because the EPA is responsible for determining whether the White Mesa Mill meets Section 121(d)(3) of CERCLA and 40 C.F.R. § 300.440 of the National Contingency Plan (also known as the "Off-Site Rule"), which mandates that such material may only be transferred to a facility that is operating in compliance with applicable federal and state law.[1]

There are several serious and ongoing environmental contamination issues at the WMM. First, the WMM has caused groundwater contamination beneath the facility, and the constituents present in the contaminated groundwater indicate containment failure or releases from the facility's legacy tailings impoundments.[2] Second, there is uncontroverted scientific evidence that off-site migration of both uranium and vanadium from the WMM facility operations has caused the contamination of surface water, land, and vegetation (on lands located off the WMM property). Third, the WMM has violated and is currently violating the federal radon emissions standards in 40 C.F.R. Part 61, subpart W: it is in violation of the federal work practice standard that limits uranium mills to only two tailings impoundments in operation at any one time; and between June of 2012 and the end of 2013, Radon-222 emissions from one of the tailings cells at the WMM exceeded the federal numeric emissions standard. The WMM has at least five impoundments containing 11(e)(2) byproduct material that are in operation, three of which were built before 1989.

---

[1] The Off-Site Rule is designed to ensure that wastes from CERCLA response actions are only disposed of in properly controlled and compliant off-site facilities and to avoid having such wastes contribute to present or future environmental problems at those facilities. *See, e.g.*, 58 FR 49200-01 ("The purpose of this off-site regulation is to avoid having CERCLA wastes from CERCLA-authorized or -funded response actions contribute to present or future environmental problems by directing these wastes to management units determined to be environmentally sound. Congress and EPA have always believed that a CERCLA cleanup should be more than a relocation of environmental problems, and have attempted to ensure the proper treatment and disposal of CERCLA wastes removed from a CERCLA site.").

[2] According to an industry expert retained by the Tribe, the liner systems in Tailings Cells 1, 2, and 3 (the legacy cells built when the WMM opened in the early 1980s) are simply unsuitable for their current use because: (a) the liners did not meet industry standard when they were installed; (b) the PVC geomembrane is not suitable for an acidic environment (and cannot reasonably be expected to have survived more than 30 years in such an application, particularly with the presence of alternate feed material solvents); (c) the industry standard has become considerably more robust since installation because of failures in similar systems; and (d) there is considerable evidence that the liners are already leaking.

The presence of alternate feed material at the WMM exacerbates the existing contamination issues at the WMM. The presence of alternate feed material containing solvents and other chemicals in the legacy tailings impoundments increases the risk of containment failure and groundwater contamination from those impoundments. The presence of alternate feed material at the WMM also increases the complexity of both groundwater monitoring and air monitoring at the facility. Finally, the properties of certain types of alternate feed material (e.g., material containing higher uranium content or material that poses increased risks of exposure through fugitive dust events) increase the risk of environmental contamination and human health impacts from the WMM.

As part of an effort to address the risk of catastrophic contamination from the WMM, the Tribe has exhaustively documented its concerns and provided scientific data and reasonable requests related to the regulation of the WMM to the State of Utah and to the EPA. Despite such efforts, the EPA has continued to make Off-Site Rule Determinations to allow the WMM to receive alternate feed material from CERCLA sites. Given the level of effort that the Tribe has expended to engage the EPA in a discussion about the WMM, the Tribe is disturbed and disappointed to see that, as recently as December of 2013, the EPA has undertaken only a cursory and incomplete[3] analysis of whether the WMM is an acceptable facility to receive CERCLA waste.

The Tribe now requests that the EPA take the following actions to ensure that the Off-Site Rule determinations properly reflect the EPA's trust responsibility to protect UMU Tribal members, lands, water, and other Indian Trust Assets from harm caused by the White Mesa Mill:

- Remove the WMM from any EPA list of sites available to receive alternate feed material from CERCLA cleanup sites (and stop approving any CERCLA remedial action plan or other cleanup plan that relies on costs or other considerations associated with the transport of alternate feed material to the WMM) until the WMM has addressed the existing environmental contamination issues and has concurrently reclaimed its legacy tailings impoundments.
- Undertake much more robust analysis during any future Off-Site Rule determinations for the WMM (including, but not limited to, analysis of compliance involving all regulatory agencies or divisions with responsibilities and authorities over the facility).

[3]For example, during a recent Off-Site Rule determination, the EPA only received input from the Utah Division of Radiation Control, and not the Utah Division of Air Quality (the agency responsible for administering the Clean Air Act (and the recent Radon-222 violation)).

ISSUE SUMMARY
ENVIRONMENTAL PROTECTION AGENCY'S ROLE IN NESHAPS VIOLATIONS AT THE WHITE MESA MILL, UTAH

The White Mesa Mill ("WMM"), a uranium processing mill located in southeastern Utah and adjacent to the Ute Mountain Ute Tribe's ("Tribe") White Mesa community, is currently licensed by the State of Utah under the Atomic Energy Act, 42 U.S.C. § 2011 *et seq*. The WMM is subject to and in violation of the National Emission Standards for Radon Emissions from Operating Mill Tailings promulgated as a National Emission Standard for Hazardous Air Pollutants under the federal Clean Air Act and published in 40 C.F.R. Part 61, subpart W ("Subpart W NESHAP"). The Subpart W NESHAP imposes both a Radon-222 air emission standard on the tailings impoundments at the WMM and work practice standards for design, construction and operation of tailings impoundments that limit a uranium mill to only two tailings impoundments in operation at any one time. In designing these standards, EPA intended to limit radon emissions, ensure timely and efficient reclamation of impoundments, and avoid increased pollution of ground and surface waters. While the Utah Division of Air Quality ("UDAQ") has authority to enforce the Subpart W NESHAP through air quality permits, the United States Environmental Protection Agency ("EPA") has federal authority and responsibilities to enforce the Subpart W NESHAP at the WMM.

The WMM has violated and is currently violating the work practice standard by operating more than two tailings impoundments. The WMM has at least five impoundments containing 11(e)(2) byproduct material that are in operation within the meaning of the NESHAP work practice standard,[1] and the reclamation plan for the facility does not require the facility owners to place permanent radon barriers (or final caps to simultaneously address radon emissions and groundwater contamination) until final closure and reclamation of the facility. The EPA agrees that the WMM is currently violating the Subpart W NESHAP work practice standard, but has not taken enforcement action because some of the impoundments are covered in water. The Tribe is very concerned that the lack of enforcement by either the UDAQ or the EPA presents a heightened long-term risk of exposure to radon for the Ute Mountain Ute Tribal members living in the White Mesa Community. The Tribe has repeatedly documented its concerns regarding the work practice standard violation to the State of Utah and the EPA. The Tribe is not alone in its concerns. By letter dated January 29, 2014, the Grand Canyon Trust gave notice of its intent to bring a citizen suit under the Clean Air Act against Energy Fuels Incorporated for the past and ongoing violations of the numeric radon emission and radon work practice standards of the Subpart W NESHAP at the White Mesa Mill.

[1] The WMM has at least five impoundments that are currently licensed to receive 11(e)(2) byproduct material, all five have been used for disposal of 11(e)(2) byproduct material, all five are currently being used for disposal of 11(e)(2) byproduct material or are in standby status, and none are in final closure. *See* 40 C.F.R. § 61.252. WMM's Utah Groundwater Protection Discharge Permit also authorizes disposal of 11(e)(2) byproduct material (wastes produced from the processing of uranium ore primarily for its source material content) in all five impoundments.

In the spring of 2013, the Tribe discovered that, in June of 2012, Radon-222 emissions from one of the tailings impoundments at the WMM exceeded the federal emissions standard (with average levels 21.5 percent higher than the regulatory emissions limit and with emissions in certain areas of the impoundment more than 40 times the emissions goal set by the WMM's worker safety program). This emissions violation occurred during the de-watering process on the tailings impoundment, even though a consultant for the WMM owner documented that the violation could be permanently eliminated if the WMM owner placed a two-foot random fill (dirt) cover on the tailings impoundment. In late 2013, after almost two years of exposing the Tribal community in White Mesa to illegal levels of Radon-222, the WMM owner was able to bring the facility back under the federal Radon-222 emissions standard. However, because the WMM owner still has not placed even the recommended two-foot random fill cover on the tailings impoundment, and because the de-watering process will continue on that tailings impoundment, the Tribe anticipates that there will be future Radon-222 exceedances in the near future (and as the WMM de-waters the legacy tailings impoundments).

The 2012-2013 Radon-222 exceedance (and lack of appropriate regulatory responses from the UDAQ and the EPA) confirms the Tribe's long-term concerns about Tribal member exposure to radon during the life of the facility. If the WMM continues to operate in violation of the work practice standard and continues to perform tailings impoundment dewatering without more aggressive regulation by the State of Utah and the EPA, the Tribe can expect a high risk of long-term radon exposure to its community in White Mesa. The Tribe is very concerned about the acute human health risk presented by the ongoing and anticipated future radon emissions violations at the WMM.

The Tribe requests the EPA take the following action to ensure the EPA is meeting its regulatory and trust responsibilities to protect UMU Tribal members from harm caused by the WMM:

- Immediately consult with the Tribe about the proposed Subpart W NESHAP rulemaking. Because the UDAQ has indicated that the proposed Subpart W NESHAP rulemaking will address the work practice standard violation at the WMM, and because the Tribe is concerned that the UDAQ and the EPA may be attempting to continue to allow the violation to occur so long as there is water in some of the WMM tailings impoundments, the Tribe insists that the EPA conduct consultation with the Tribe early enough in the process that the Tribe can give meaningful and effective input prior to publishing the proposed rule for public comment.
- Immediately consult with the Tribe about: (1) EPA's decision not to pursue enforcement on the work practice standard violation; and (2) the Tribe's concerns about the Radon-222 emissions violation (including, but not limited to, the Tribe's concerns about the duration of the 2012-2013 violation, the Tribe's concerns that no federal or state agency notified the Tribe of this acute human health risk, and the Tribe's concerns that this type of emissions violation will continue to occur at the WMM).

Attachment 2

UTE MOUNTAIN UTE TRIBE'S INITIAL QUESTIONS
Environmental Protection Agency, Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings, Proposed Rule
40 C.F.R. Part 61
Submitted on June 13, 2014 in preparation for government-to-government consultation, July 10, 2014

I. EPA, INDIAN TRIBES, AND EXECUTIVE ORDER 13175

1. The Environmental Protection Agency's (EPA) statement regarding compliance with Executive Order 13175 states that the Subpart W rulemaking action does not have "tribal implications" because the rulemaking does not impose regulatory requirements on tribal governments. Please be prepared to discuss how the following issues impact the EPA's Executive Order 13175 analysis:

    - Although Native Americans make up only 1.4 percent of Utah's racial profile (and 0.9 percent of the United States' racial profile), they make up 55.8 percent of the racial profile for San Juan County, Utah (the county where the White Mesa Mill (WMM) is located).
    - The WMM facility is located on aboriginal lands of the Ute Mountain Ute Tribe.
    - The WMM facility is located adjacent to land and other Indian Trust Assets held in trust by the United States on behalf of the Ute Mountain Ute Tribe (and less than 3 miles from the nearest Tribal resident).
    - The Tribal community located in White Mesa is downgradient of the WMM facility.
    - The Tribal community located in White Mesa is completely dependent on groundwater supplies located underneath the WMM facility and tailings cells.
    - Activities and operations at the WMM have already impacted Tribal members' abilities to use surface, plant, wildlife, and surface water resources on public and Tribal lands.

2. Please be prepared to discuss how the EPA will address Tribal concerns during this Subpart W rulemaking and related rulemaking processes (including, but not limited to, the anticipated revision to 40 C.F.R. Part 192).

3. Please be prepared to discuss how or whether the EPA undertook analysis of how this rulemaking will impact UMU Tribal members, UMU Tribal lands, and Indian Trust Assets.

II. NESHAPS/CLEAN AIR ACT QUESTIONS

4. Has the EPA evaluated establishing a lesser quantity or different criteria for major sources of radionuclides under Section 112(a)(1) of the CAA? *See* footnote 2, page 25390 of the proposed rulemaking (noting that *none* of the uranium recovery facilities are major sources under NESHAPS).

5. On page 25390 of the proposed rulemaking, the EPA identifies the "source category" for Subpart W using 40 C.F.R. § 61.250 and the proposed definition of "uranium recovery facility." Has the EPA listed uranium recovery facilities as a category or subcategory of sources under Section 112(c) of the Clean Air Act? If so, please provide an explanation and documentation in advance of the consultation meeting.

6. On page 25390 of the proposed rulemaking, the EPA states, "Subpart W requirements specifically apply to the affected sources at the uranium recovery facilities that are used to manage or contain the uranium byproduct material or tailings." However, the proposed Subpart W rulemaking only covers some HAP sources at uranium recovery facilities, and not others (such as stackhouses, ore pad, ore grinder, and the Mill yard, see Question 7, *infra*). Please explain the EPA's rationale for excluding such HAP sources at conventional uranium mills.

7. On page 25390 of the proposed rulemaking, the EPA states: "We presently have no data or information that shows any other HAPs being emitted from these impoundments." Please provide a response to the following initial questions, data, and information regarding other HAPs that may be emitted from the WMM.

   - The WMM's 10 C.F.R. § 40.65 environmental airborne particulate monitoring program monitors for natural uranium (Uranium-238, Uranium-234, Uranium-235), Thorium-230, Radium-226, and Lead-210. This air monitoring program has detected all four isotopes at all of the air monitoring stations. Additionally, the WMM has identified Lead-210, Thorium-230, Thorium-232, Polonium-210, Radium-226, and Radium-228 in wastewater samples from the tailings impoundments. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
   - The WMM processes uranium ore. During the uranium storage and milling processes, there may be more than three dozen radioactive isotopes present at the WMM facility (including actinium, astatine, bismuth, francium, lead, polonium, protactinium, radium, radon, thallium, thorium, and uranium). *See* Uranium Decay Series diagram on page 44 of the Technical and Regulatory Support document. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
   - The WMM's uranium milling process uses significant quantities of chemicals (sodium chlorate is used during ore oxidation; sulfuric acid and flocculants are used during the leaching and clarification; secondary amines/kerosene, tri-alkyl amines/tributyl phosphate modifier, and quaternary ammonium compounds/alcohol are used during the solvent extraction; chlorides and sulfates are used during pregnant liquor stripping; and ammonia hydroxide and sodium hydroxide during yellowcake precipitation). During the storage and use of these chemicals, and after these chemicals are disposed in the tailings impoundments, there may be significant emissions of HAPs at the WMM.

- The WMM processes alternate feed materials. During the alternate feed storage and milling processes, other radioactive isotopes, non-metal compounds, and other regulated HAPs may be emitted from the WMM.
- The WMM processes vanadium ore. Vanadium is considered to be dangerous to life and health by both the Occupational Safety and Health Administration and the National Institute for Occupational Safety and Health, and may be listed as a HAP in the future. The WMM's vanadium recovery process uses a significant quantity of chemicals (sodium chlorate is used during the redox/pH adjustment; kerosene and secondary amines are used during the solvent extraction; soda ash is used during the vanadium pregnant liquor stripping process; and ammonia hydroxide is used during the vanadium precipitation). This indicates that the vanadium recovery process results in the emission of HAPs other than Radon-222 from the WMM facility.

8. On page 25390 of the proposed rulemaking, the EPA states that it evaluated the MACT standards applicable to major sources in the same industrial sector. Please provide the Tribe with this analysis prior to the consultation, and be prepared to explain the MACT analysis that the EPA performed during this rulemaking process.

9. Please explain how the EPA evaluated the use of a work practice standard, rather than an emissions standard, for the control of a HAP under the proposed rulemaking. *See* Section 112(h), Clean Air Act. Please specifically address the EPA's determination to remove the current emissions standard for existing impoundments. Please also explain how removing the emissions standard from Subpart W will affect: (a) how the WMM facility sets and meets the ALARA goal to protect worker and adjacent communities from radionuclides; and (b) monitoring of radon emissions under 10 C.F.R. Part 40, Appendix A.

III. SUBPART W AND CLOSURE OF LEGACY IMPOUNDMENTS

10. In 1989, when the EPA proposed the current Subpart W NESHAP, the EPA concluded that, "Existing mill tailing piles are large piles of waste that emit radon. There is nothing that can be done to reduce the amount of radon they emit except cover them." 54 FR 9644 (March 7, 1989). EPA crafted Subpart W to prohibit uranium mills from having more than two tailings impoundments in operation. Explain why the EPA has not required closure of the legacy Tailings Cells 1, 2, and 3 at the WMM, as contemplated and required by the current NESHAP.

11. In this proposed rulemaking, the EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Explain how the EPA can justify the long-term risk of having almost 300 acres of tailings impoundments that are either in operation or in closure but without a permanent radon barrier at the WMM. *See also* questions on conventional and non-conventional impoundments.

IV. DEFICIENT OR INCORRECT ANALYSIS OF OPERATIONS AND FACILITIES AT THE WMM

12. The owners of the WMM state in the June 1, 2009 letter response to EPA's CAA Section 114 Information Request that Tailings Cells 1, 2, and 3 meet the requirements of 40 C.F.R. 192.32(a). The WMM owners specify that these specific Tailings Cells meet the design and operating requirements under 40 C.F.R. 264.221(a). Please explain how the EPA evaluated the WMM owners' assertions regarding compliance with 40 C.F.R. 192.32(a) and 40 C.F.R. 264.221(a), given the following:
    - The liners in Tailings Cells 1, 2, and 3 were designed for a 15-year life and were installed between May 1980 and September 1982. These impoundments have already been in operation for over 30 years.
    - Contamination of the shallow groundwater underlying Tailings Cells 1, 2, and 3 has been documented and is the subject of investigation and corrective action to address elevated chloroform, nitrate and chlorides. There is significant evidence that the liners on Tailings Cells 1, 2, and 3 have already allowed migration of waste out of the impoundments into the adjacent groundwater.
    - The Agreement State and the WMM owners treat the shallow groundwater aquifer under the WMM facility as the leak detection system for Tailings Cells 1, 2, and 3 (and developed a groundwater monitoring program that can detect tailings cell leakage only after waste has migrated out of these legacy impoundments).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 do not have appropriate chemical properties and sufficient strength and thickness to prevent failure due to conditions outlined in 40 C.F.R. § 264.221(a)(1).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 are not compatible with alternate feed materials contained in the impoundments.

13. Several important sections of the proposed rulemaking rely on the provisions of 40 C.F.R. § 264.221(c) (and not 40 C.F.R. § 264.221(a)) to explain protection of groundwater or other environmental analysis. *See, e.g.*, page 25393 (setting forth specific liner requirements from 40 C.F.R. § 264.221(c)); page 25397 (specifically relying on safeguards from a leak detection system); page 25401 (specifying that the proposed GACT is for double liners on non-conventional impoundments). The provisions of 40 C.F.R. § 264.221(c) are significantly more protective of groundwater, human health, and the environment.

    - Is the EPA taking the position that all conventional impoundments and non-conventional impoundments must meet the requirements of 40 C.F.R. § 264.221(c)? If so, please clarify the EPA's position on whether Tailings Cells 1, 2, and 3 at the WMM meet the requirements of 40 C.F.R. § 264.221(c).

    - If the EPA is <u>not</u> taking the position that 40 C.F.R § 264.221(c) applies to all conventional and non-conventional impoundments, please explain how the EPA addressed risks to groundwater from legacy impoundments like Tailings Cells 1,

2, and 3. Please specifically address how the EPA assessed the risk of groundwater contamination from Tailings Cell 1. *See* question 12, *supra*.

14. Please explain how (or if) the EPA's specific analysis of the WMM facility addressed the following:

    - Cell 2 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
    - Method 115 monitoring on Cell 2 detected a Subpart W NESHAPS violation in 2012/2013 over the 20 pCi/m2-s limit.
    - Cell 3 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
    - Cell 3 is currently the only tailings cell at the WMM that receives certain forms of 11(e)(2) byproduct material (materials trucked in, including ISL waste).
    - The WMM facility has not historically operated its "conventional" and "non-conventional" tailings impoundments separately. Tailings Cell 4A was operated as a "non-conventional" impoundment, which resulted in surface and groundwater contamination until the cell was retrofitted starting in 2008. Tailings Cell 4B is currently operated as a "non-conventional" impoundment, but the WMM owners indicate that it will be used as a "conventional" impoundment in the future.
    - Under currently approved and proposed reclamation plans for the WMM, the permanent radon barriers will not be placed on *any* tailings impoundments until final reclamation at the facility.

V. NON-CONVENTIONAL IMPOUNDMENTS

15. How did the EPA develop the proposed definition of "non-conventional impoundments"?

16. Please explain how the EPA will distinguish between conventional and non-conventional impoundments.

    a. Is there a minimum amount of liquid that must be present in the pond for the EPA to classify a tailings impoundment as a non-conventional impoundment, or can a facility owner convert a conventional impoundment into a non-conventional impoundment by adding the minimum 1m of liquid on the top of the impoundment?

    b. Will the final reclamation or removal plan for a tailings impoundment determine whether it qualifies as a "non-conventional impoundment"?

        - Please explain how the EPA will treat Tailings Cell 1 at the WMM (noting that the WMM owners plan to remove solids from the cell upon final reclamation, but then permanently dispose of debris from the Mill facilities and contaminated soil in the cell). *See* June 1, 2009 Response Letter at 6; page 25405 of the proposed rulemaking (addressing the disposal of byproduct material like deconstruction material during facility reclamation).

- Please explain how the EPA will treat Tailings Cell 4B at the WMM (which the WMM owner is currently operating as a non-conventional impoundment, but which will become a conventional impoundment before final reclamation).

17. The WMM is currently authorized to temporarily place liquid 11(e)(2) byproduct material in "Roberts Pond" (before pumping the liquid into Tailings Cells 1 and 4B). Does Roberts Pond meet the proposed definition of a "non-conventional impoundment"? *See* pages 25390, 25393 of the proposed rulemaking (addressing "holding" and "collection" ponds). Please explain how EPA has assessed the Radon-222 emissions from Roberts Pond and from the regular transfer of process water from Roberts Pond to Tailings Cells 1 and 4B.

18. Please explain the EPA's rationale for allowing non-conventional impoundments to exist until removal at facility closure.

    - Did the EPA analyze whether allowing water-covered impoundments to exist for the life of a facility increases risks of groundwater and surface water contamination? Please see question 12 (and explain EPA's position on the 15-year design life for Tailings Cell 1 at the WMM).
    - How will the EPA ensure that non-conventional impoundments are periodically retrofitted to ensure that the impoundments do not contaminate groundwater and surface water?

19. EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Please explain why this linear relationship does not also justify size restrictions on non-conventional impoundments (and please specifically address how this linear relationship will impact Radon-222 emissions when large non-conventional impoundments are dewatered and closed).

20. How has the EPA analyzed what risks non-conventional impoundments (including large non-conventional impoundments like Tailings Cell 1 at the WMM) will pose to human health and the environment when they are de-watered and decommissioned?

21. How will the proposed rule address tailings impoundments that are used as conventional and non-conventional impoundments (such as Tailings Cells 4A and 4B at the WMM)? How will the EPA "count" these cells using the 2-cell limit in the conventional impoundment work practice standard?

22. The EPA's analysis that using liquids to cover tailings cells "has been sufficient to limit the amount of radon emitted from the ponds, in many cases, to almost zero" is insufficient to demonstrate that Tailings Cell 1 at the WMM has a radon flux of "almost zero" (or even under 20 pCi/m2-s).

Based on the information and questions below, please provide the EPA's specific analysis of the calculated radon emissions from Tailings Cell 1, Tailings Cell 4B, and Roberts Pond at the WMM. Please then explain how EPA calculates the dose to the White Mesa Tribal community (considering radon emissions from Tailings Cell 1 and 4B and Roberts Pond, along with radon emissions from "conventional" impoundments 2, 3, and 4A).

a. The proposed rulemaking recognizes that covering tailings impoundments with water does not reduce radon emissions to zero. *See, e.g.*, Radon Emission from Evaporation Ponds (noting that the radon flux above some evaporation ponds can be significant/exceed 20 pCi/m2-s).
b. The proposed rulemaking contemplates the use of radium-laden "process water" to provide liquid covers on non-conventional impoundments, but does not address whether the use of radium-laden process water increases the radon emissions from a non-conventional impoundment. The EPA analysis justifying the use of the 1 meter water cover relies on the assumption that the water cover is not laden with radium. The EPA analysis also calculates significant radon flux from non-conventional impoundments containing radium-laden water. Please justify the EPA's position that 1 m of radium-laden process water can decrease radon flux from tailings impoundments like Tailings Cell 1 at WMM to zero.
c. The EPA's analysis of radon emissions from liquid-covered impoundments recognizes that there are significant radon emissions during the transfer of radium-laden waters to and between tailings impoundments and during enhanced evaporation sprays, but it does not calculate or address these emissions for conventional mills like the WMM.
d. Using the radon flux equation contained in Section 4.0 of the Radon Emissions from Evaporation Ponds report along with the actual radium content[1] in Tailings Cell 1, the Tribe's initial calculation on the radon flux from Tailings Cell 1 is 327 pCi/m2-s (not including emissions during transfer into Cell 1 or during enhanced evaporation sprays).

VI. CONVENTIONAL IMPOUNDMENTS

23. The Tribe is generally confused about the EPA's approach to Tailings Cells 2 and 3 at the WMM. The EPA seems to recognize that neither of these tailings cells meets the work practice standards proposed in this rulemaking. *See* page 25395 of the proposed rulemaking (noting that Cell 3 could not meet the work practice standards). Given that both tailings impoundments are still licensed by the Agreement State to receive liquid and solid 11(e)(2) byproduct material and that neither tailings impoundment has a tailings closure plan with milestones for placement of a permanent radon barrier, please explain how the EPA can continue to justify removing the monitoring requirements and emissions limits that currently apply to these impoundments.

[1] To determine the actual radium content, the Tribe used the 32,700 pCi/L Gross Radium Alpha concentration provided in the in the 2013 Annual Tailings Report.

24. The Tribe is concerned that, although Tailings Cell 2 had a recent violation of the 20 pCi/m2-s emissions limit that applies to existing impoundments (and although that violation was detected during monitoring conducted under Method 115), the EPA did not consider Cell 2 when considering how the proposed rulemaking would impact the WMM. Please explain why the EPA omitted any analysis of Cell 2 and the recent Subpart W violation at Cell 2. Please also explain how the EPA will ensure that emissions from Tailings Cell 2 do not exceed 20 pCi/m2-s between now and when the final radon barrier is placed during final reclamation of the entire facility (given that the EPA is proposing to eliminate both the emissions limit and the monitoring to detect Radon-222 emissions over 20 pCi/m2-s).

25. The proposed rulemaking references the use of an "interim cover" on Tailings Cells 2 and 3 at the WMM. The Tribe is concerned that the WMM owners have used this "interim cover" on Tailings Cell 2 for more than a decade (and that the use of this cover has already resulted in Radon-222 emissions of over the 20 pCi/m2-s limit) and that the Reclamation Plan for the WMM contemplates the use of such "interim covers" until final reclamation at the facility. Please explain whether and how the EPA justifies the use of interim covers (and not the immediate placement of permanent radon barriers).

VII. APPLICABILITY OF 40 C.F.R. PART 192

26. A significant portion of the EPA's analysis in the proposed rulemaking (including analysis on impacts to the environment and human health, analysis on weather and other hazards, and economic analysis) rests on the assumption that all tailings impoundments (conventional and non-conventional) meet the standards set forth in 40 C.F.R. § 192.32(a)(1) and 40 C.F.R. § 264.221. How will the EPA ensure that all the tailings impoundments at the WMM facility meet the applicable federal standards?

27. The EPA is proposing to eliminate internal cross references to the sections of 40 C.F.R. Part 192 that cover placement of permanent radon barriers on tailings impoundments. Additionally, although the EPA identified the need to better define "closure" under Subpart W, the revisions to the terms "standby" and "operation" in the proposed rulemaking do not define or address "closure" under the revised Subpart W NESHAP regulations.
    - How will the EPA determine whether a tailings impoundment has entered "final closure" for Subpart W NESHAP purposes?
    - If the EPA no longer intends to utilize other portions of 40 C.F.R. Part 192 (including, but not limited to, the definitions of "Tailings Closure Plan," "Permanent Radon Barrier," and requirements that the permanent radon barrier be constructed as expeditiously as possible and in accordance with a tailings closure plan), how will the EPA ensure that permanent radon barriers are properly placed on tailings cells? Here, please address the Tribe's concern that, under current reclamation plans for the WMM, the permanent radon barriers for Cells 2 and 3 will not be placed under final reclamation of the facility (and that there are no Tailings Closure Plans, as defined in 40 C.F.R. Part 192, with milestones for the expeditious placement of the permanent radon barriers).

28. The Tribe is concerned that the Tribal community in White Mesa will be exposed to elevated levels of Radon-222 when the WMM facility undertakes de-watering or other closure activities or allows Tailings Cells 2 and 3 to remain open under an "interim cover." Please explain how the EPA has specifically assessed the anticipated dose to the White Mesa Community *during* the closure period. Please also explain how the EPA will ensure that Tribal members, Tribal lands and other Indian Trust Assets are not exposed to Radon-222 emissions in excess of 20 pCi/m2-s during the closure period.

Subject: Congressional Inquiry

All,

Staff from Senator Udall (CO) have contacted our congressional office regarding issues with the Ute Mountain Ute tribe. The tribe contacted the Senator's office to discuss the Subpart W proposed rulemaking. I believe they will be expressing their disappointment with our consultation taking place after the rule was proposed. I explained to Josh Lewis that we would be available next week to speak to the staff regarding our communications with the tribe over the last 5 years.
Thanks

Reid

Memo to: EPA Docket (EPA-HQ-OAR-2008-0218)

From: Anthony Nesky, EPA/OAR/ORIA/RPD

Subject: Request for a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule."

On June 10, 2014, Jennifer Thurston of INFORM Colorado called Anthony Nesky of the EPA Radiation Protection Division (RPD) in the Office of Radiation and Indoor Air (ORIA), in the Office of Air and Radiation (OAR), at the U.S. Environmental Protection Agency (EPA) to request a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule," 79 Fed. Reg. 25,388 (May 2, 2014), which proposes revisions to 40 CFR Part 61, Subpart W. Ms. Thurston explained that she was requesting the public hearing on behalf of a number of organizations who wanted public hearings in multiple locations.

Hell Mr. Rosnick:

I am pleased to forward on a letter from the NTAA Chairman, Bill Thompson regarding EPA Docket # EPA-HQ-OAR-2008-0218. This letter requesting a comment period extension is in advance of NTAA's forthcoming comments on this proposed rule.

Please confirm receipt of this letter and feel free to contact me with any clarification and/or questions regarding this request.

We look forward to response to this request.

Thank you,

Subject: Two quick fixes to Subpart W page and RPD home page

Dear Carmen:

Thanks for your help yesterday. We were facing a hard deadline to update the Subpart W page. I have a minor fix for it. Could you please fix the envelope graphic on at the top of the page:

http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html

We have announced that we are planning to extend the comment period for Subpart W, so we ought to update the home page as well. On the RPD home page, under

- "**Notice of Proposed Rulemaking** National Emission Standards for Hazardous Air Pollutants (NESHAPs)- Radon from Operating Uranium Mill Tailings EPA has released a Notice of Proposed Rulemaking that would revise "National Emission Standards for Radon Emissions from Operating Mill Tailings," Subpart W of 40 CFR Part 61. The public is invited to submit comments on the proposed rulemaking. Comments must be received in writing by July 31, 2014.

Please delete the last two sentences, and replace them with;

The comment period is open. The public is invited to submit comments on the proposed rulemaking.

Thanks for the corrections Reid.

Yes, you can assume that time frame if that works for you.

I will ensure that your name is correct on the final agenda.

I will ensure you get the call in information this week.

Thanks,

Andy

NESHAP Subpart W is a radon emission standard for operating uranium mill tailings. In accordance with the Clean Air Act Amendments of 1990, EPA formed a workgroup to review the standard.

EPA will provide up-to-date information on recent or upcoming conference calls, resources, public hearings and contact information. Please check back regularly, as more items will be added.

On this page:

Requests for a Public Hearing

EPA has received two requests for a public hearing on the proposed rulemaking for NESHAP Subpart W. EPA plans to conduct a public hearing in response to these requests. The Agency is currently planning the public hearing and will post the information regarding the public hearing (dates, location, times, registration information, etc.) on this website as soon as it has been finalized. Interested parties should check this website for updates.

- Memo to Docket on Telephone Request for Public Hearing (PDF) (1 pp, 196 KB About PDF)
- Letter from Uranium Watch (PDF) (1 pp, 42.9 KB About PDF)

Requests for Extension of the Public Comment Period

EPA has received two requests for EPA to extend the public comment period for the proposed rulemaking for NESHAP Subpart W. The public comment period currently ends on July 31, 2014. The requestors have asked EPA to extend the public comment period by 120 days. EPA plans to extend the public comment period in response to these requests but has not yet determined the length of that extension. EPA will publish a Federal Register notice when it finalizes its decision regarding the extension of the public comment period. EPA will also post information regarding the extension of the public comment period on this website as soon as it has been finalized. Interested parties should check this website for updates.

- Request from Uranium Watch (PDF) (2 pp, 58.9 KB About PDF)
- Request from NTAA (PDF) (1 pp, 32.4 KB About PDF)

EPA is proposing revisions to Subpart W.Comment period is open

"National Emission Standards for radon emissions from Operating Uranium Mill Tailings," Subpart W of 40 CFR Part 61. The proposed rule would require the use of generally available control technology (GACT) to limit radon emissions from tailings at all uranium recovery facilities. Specific control technologies would be required at conventional tailings impoundments, evaporation ponds and heap leach piles. The public is invited to submit comments on the proposed rulemaking. The docket (EPA-HQ-OAR-2008-0218) for this proposed rulemaking may be accessed at Regulations.gov. Once in the docket, you can view the proposed rule and supporting documents. The public comment period currently ends on July 31, 2014. EPA plans to extend the public comment period.

If anyone contacts EPA requesting to speak at a public hearing concerning this proposed rule by July 1, 2014, we will hold a public hearing. If you are interested in attending the public hearing, contact Mr. Anthony Nesky at (202) 343-9597 to verify that a hearing will be held and if you wish to speak. If a public hearing is held, we will announce the date, time and venue on our website at http://www.epa.gov/radiation.

Historical Rulemakings

April 6 1983 Proposed Rule (17 pp, 2.33 MB), April 1983
This is a 1983 proposal for regulating hazardous air pollutants.

40 CFR Part 61 192.32 a (2 pp, 287 K), October 1983
These are the operating standards for uranium recovery facilities (Subpart W).

October 31 1984 ANPR Radionuclides (13 pp, 1.85 MB), October 1984
This document is EPA's advance notice of a proposed rulemaking concerning radionuclides in 1984.

40 CFR Part 61 General Requirements (4 pp, 594 K), November 1985
These are the general operating and permitting requirements for NESHAP facilities.

Geotechnical & Geohydrological Aspects of Waste Management (3 pp, 428 K) February 1986
Surface water hydrology considerations in predicting radon releases from water-covered areas of uranium tailings ponds.

Background Information Document for Final Rule for Radon-222 Emissions from Licensed Uranium Mill Tailings (224 pp, 6.25 MB), [EPA 520-1-86-009], August 1986
This is the background information used to make the determination on the Subpart W rule.

September 24 1986 Final Rule (13 pp, 3.17 MB), September 1986
This is a 1986 rule that establishes work practices at uranium tailings facilities.

Draft EIS Statement for Proposed NESHAPS for Radionuclides (260 pp, 7.76 MB), [EPA 520-1-89-005], February 1989
This document is a draft of the original 1989 environmental impact statement for the 1989 NESHAP rulemaking.

March 7 1989 Proposed Rule (58 pp, 8.19 MB). March 1989
This is a proposed rule for the NESHAP requirements.

Risk Assessments Methodology, EIS, NESHAPS for Radionuclides (1) (278 pp, 12,433 K), [EPA 520-1-89-005], September 1989
This is the environmental impact statement for the 1989 NESHAP rulemaking.

Risk Assessments Methodology, EIS, NESHAPS for Radionuclides (2) (378 pp, 27 MB), [EPA 520-1-89-006-2], September 1989
This is the environmental impact statement for the 1989 NESHAP rulemaking.

Risk Assessments Methodology, EIS, NESHAPS for Radionuclides (3) (575 pp, 1 2MB), [EPA 520-1-89-007], September 1989
This is the environmental impact statement for the 1989 NESHAP rulemaking.

December 15 1989 Final Rule (63 pp, 9.25 MB), December 1989
This is the final rule for regulating hazardous air pollutants using NESHAP.

Method 115 (3 pp, 443 K), December 1989
This is the monitoring method which must be used to determine radon emissions for Subpart W.

Subpart T Rescission (24 pp, 3.38 MB), December 1991
This document describes how EPA's uranium tailings disposal standards apply to the Department of Energy.

40 CFR Part 61 192.32 a Errata (1 pg, 131 K), November 1993
This rule replaces some language from the original operating standards for uranium recovery facilities (Subpart W).

40 CFR Part 61 General Requirements Errata (2 pp, 312 K), March 1994
This rule replaces some language from the original general operating and permitting requirements.

EPA Procedures for Determining Confidential Business Information (9 pp, 96.9 K), July 1995
This document describes the process EPA uses to determine if information is confidential business information, for purposes of the Freedom of Information Act (FOIA).

October 17 2000 Errata (1 pg, 127 K), October 2000
This document clarifies some test method and procedures language.

NRC's In-Situ Leach Facility Standard Review Plan (255 pp, 193 MB), June 2003
This NRC document provides guidance to NRC staff on reviewing applications to develop and operate uranium recovery facilities.

IAEA Uranium Mill Tailings Report (309 pp, 7.30 MB), August 2004
This document details international efforts to ensure long-term stabilization of uranium mill tailing.

EPA Contract number EP-D-05-002 (103 pp, 10.9 MB), November 2004
This document is the contract between EPA Office of Radiation and Indoor Air and S. Cohen and Associates. Note that this contract expires on March 26, 2010.

Construction of an Environmental Radon Monitoring System using CR-39 Nuclear Track Detectors (6 pp, 746. K) December 2004

Section 114 Letters/Responses
These documents are EPA requests (with responses as they are received) for facility information from uranium recovery facilities

- Cogema Part 1 - October 8, 2008 Response (23 pp, 7.73 MB), October 2008
- Cogema Part 2 - November 14, 2008 Response (17 pp, 5.50 MB), November 2008
- Cogema request for Radon Flux Monitoring (10 pp, 2.44 MB)
- Uranium Highland (10 pp, 2.7 MB), February 2009
- Uranium Highland Response to Section 114 Letter (10 pp, 3,01 K), March 2009
- Cameco request for Radon Flux Monitoring (10 pp, 2.46 MB)
- Uranium Energy Solutions (10 pp, 2.37 MB), February 2009
- Uranium Energy Solutions Response to Section 114 Letter (10 pp, 3,167 K), March 2009
- Uranium Denison (10 pp, 2.33 MB), February 2009
- Denison Response to Section 114 Letter (26 pp, 1.25 MB)
- Denison request for Radon Flux Monitoring (12 pp, 2.57 MB)
- Uranium Cotter (10 pp, 2,529 K), May 2009
    - 2009-05-29 Cotter's Cover Letter (1p, 22.7 K)
    - 2009-05-29 Cotter's Request for Information (29 pp, 127.8 K)
    - 2009-05-28 Cotter's Document Index (5 pp, 33.9 K)
    - Attachment 1 (5 pp, 1.5 MB)
    - Attachment 1(a) (1pg, 147.1 K)
    - Attachment 1(b) (1pg, 368.8 K)
    - Attachment 1(c) (1pg, 360.6 K)
    - 2009-05-29 Cotter's response to EPA's request to test (2 pp, 41.4 K)
- Cotter request for Radon Flux Monitoring (10 pp, 2.47 MB)
- Mestena request for Radon Flux Monitoring (10 pp, 2.45 MB)
- Mestena response to request for Radon Flux Monitoring (1p, 248.8 K)
- Crow Butte request for Radon Flux Monitoring (10 pp, 2.44 MB)

Mine Location Database

EPA worked with the multi-agency Colorado Plateau Data Coordination Group Steering Committee to develop a geographic information database on uranium mines and mills. (The Agency also coordinated this effort with federal, state, and tribal agencies in other parts of the western U.S.)

The database identifies and shows the location of active and inactive uranium mines and mills, as well as mines which principally produced other minerals, but were known to have uranium in the ore. The database covers mine locations in fourteen western states. It also contains other information about the sites. Originally compiled as an important component of the uranium mining technical reports currently being developed, the database was reviewed and checked for its quality to eliminate duplicate and erroneous sites, and subjected to EPA’s scientific peer review process.

The database and descriptive materials about its content are now available.

Subject: Couple of real quick changes to the Subpart W page

Dear Carmen:

Thanks for turning this around so quickly:
Here are a couple of quick changes

1.
Under "on this page:
Please add jumps to

- Request for a Public Hearing
- Requests for Extension for the Public Comment Period.

2. FIX LINKS
The links to the Uranium Watch files are reversed. Please switch them, so that that Letter from Uranium Watch points to "UraniumWatchHearingRequest6-10-14" and Request from Uranium Watch points to Uranium WatchHearingRequest6-10-14.pdf"

3. Changes to "EPA is proposing revisions to Subpart W.Comment period is open

In the last sentence, "EPA plans to extend the public comment period." Please hyperlilnk "extend the public comment period" to the jump to "Requests for a Public Hearing."

Please call if you have any questions. Thanks for your help!

Subject: We have to make some changes to the Subpart W page today
Importance: High

Cara Carmen,

We have some changes to the Subpart W page that will need to be posted today. Please post to the staging server so that all parties can review before we finalize.
On:
http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html
Please add the following two sections before the section "EPA is proposing revisions to Subpart W."

Requests for a Public Hearing
EPA has received two requests for a public hearing on the proposed rulemaking for NESHAP Subpart W. EPA plans to conduct a public hearing in response to these requests. The Agency is currently planning the public hearing and will post the information regarding the public hearing (dates, location, times, registration information, etc.) on this website as soon as it has been finalized. Interested parties should check this website for updates.
Requests for a public hearing—

- Memo to Docket on Telephone Request for Public Hearing (PDF
- Letter from Uranium Watch(PDF…)

Requests for Extension of the Public Comment Period
EPA has received two requests for EPA to extend the public comment period for the proposed rulemaking for NESHAP Subpart W. The public comment period currently ends on July 31, 2014. The requestors have asked EPA to extend the public comment period by 120 days. EPA plans to extend the public comment period in response to these requests but has not yet determined the length of that extension. EPA will publish a Federal Register notice when it finalizes its decision regarding the extension of the public comment period. EPA will also post information regarding the extension of the public comment period on this website as soon as it has been finalized. Interested parties should check this website for updates.
Requests for an extension of the public comment period—

- Request from Uranium Watch (PDF….)
- Request from NTAA (PDF..)

Note to Carment All of the PDF files for the above are attached, except for the Memo to the Docket, which I am still working on.

Metadata for the PDF files are as follows--

- *File: Uranium WatchHearingRequest-6-10-14*
  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: Uranium Watch
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, hearing request.

- *File: Uranium WatchExtensionRequest-6-12-14*
  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: Uranium Watch
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, comment period extension request.

- *File: NTAA_CommentExtReq_SubpartWRule*

  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: NTAA
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, comment period extension request.

After inserting the two sections above, please change the next section as follows--

EPA is proposing revisions to Subpart W. Comment period is open.

"National Emission Standards for radon emissions from Operating Uranium Mill Tailings," Subpart W of 40 CFR Part 61. The proposed rule would require the use of generally available control technology (GACT) to limit radon emissions from tailings at all uranium recovery facilities. Specific control technologies would be required at conventional tailings impoundments, evaporation ponds and heap leach piles. The public is invited to submit comments on the proposed rulemaking. The docket (EPA-HQ-OAR-2008-0218) for this proposed rulemaking may be accessed at Regulations.gov. Once in the docket, you can view the proposed rule and supporting documents . The public comment period currently ends on July 31, 2014 . EPA plans to extend the public comment period

Requests for Extension of the Public Comment Period
EPA has received two requests for EPA to extend the public comment period for the proposed rulemaking for NESHAP Subpart W. The public comment period currently ends on July 31, 2014. The requestors have asked EPA to extend the public comment period by 120 days. EPA plans to extend the public comment period in response to these requests but has not yet determined the length of that extension. EPA will publish a Federal Register notice when it finalizes its decision regarding the extension of the public comment period. EPA will also post information regarding the extension

of the public comment period on this website as soon as it has been finalized. Interested parties should check this website for updates.

Requests for an extension of the public comment period—

- Request from Uranium Watch (PDF….)
- Request from NTAA (PDF..)

Note to Carment All of the PDF files for the above are attached, except for the Memo to the Docket, which I am still working on.

Metadata for the PDF files are as follows--

- *File: Uranium WatchHearingRequest-6-10-14*
  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: Uranium Watch
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, hearing request.

- *File: Uranium WatchExtensionRequest-6-12-14*
  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: Uranium Watch
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, comment period extension request.

- *File: NTAA_CommentExtReq_SubpartWRule*

  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: NTAA
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, comment period extension request.

After inserting the two sections above, please change the next section as follows--

EPA is proposing revisions to Subpart W. Comment period is open.

"National Emission Standards for radon emissions from Operating Uranium Mill Tailings," Subpart W of 40 CFR Part 61. The proposed rule would require the use of generally available control technology (GACT) to limit radon emissions from tailings at all uranium recovery facilities. Specific control technologies would be required at conventional tailings impoundments, evaporation ponds and heap leach piles. The public is invited to submit comments on the proposed rulemaking. The docket (EPA-HQ-OAR-2008-0218) for this proposed rulemaking may be accessed at Regulations.gov. Once in the docket, you can view the proposed rule and supporting documents . The public comment period currently ends on July 31, 2014 . EPA plans to extend the public comment period

National Tribal Air Association
P.O. Box 15004
Flagstaff, AZ 86011-5004

June 13, 2014

Reid J. Rosnick
Office of Radiation and Indoor Air
Radiation Protection Division
U.S. Environmental Protection Agency
Via email to rosnick.reid@epa.gov

Dear Mr. Rosnick,

The National Tribal Air Association (NTAA) is an autonomous organization with 80 principal member Tribes. The organization's mission is to advance air quality management policies and programs, consistent with the needs, interests, and unique legal status of Indian Tribes. As such, the NTAA uses its resources to support the efforts of all federally recognized Tribes in protecting and improving the air quality within their respective jurisdictions.

On behalf of the NTAA, I am writing to request that EPA extend the public comment period for the proposed rule issued in the Federal Register on May 2, 2014, which would revise Subpart W of 40 CFR Part 61, "*National Emission Standards for Operating Uranium Mill Tailings*". Specifically, the *NTAA is requesting the maximum comment extension period of 120 days*.

This rule addresses both conventional uranium milling operations as well as future extraction activities, namely in-situ leach/recovery (ISL) sites. Domestic uranium milling and mining operations to date have left in their wake a disturbing legacy of environmental injustice in Indian Country. As a national organization whose mission it is to advance air quality management and policies for federally recognized Tribes, it is only prudent that NTAA thoroughly evaluate the consequences of the proposed rule, including the potential impacts on Tribal communities, and subsequently provide comments to EPA. Given the serious complexity of the proposed rule, as well as the wide ranging implications for affected Tribes, we strongly request that you grant the aforementioned extension.

For our part, NTAA was only made aware of the proposed rule within the last two weeks. The public comment extension will help to promote a just and equitable public participation process by giving the NTAA, member Tribes, and those Tribes indicated on EPA's consultation list adequate time to examine the complex science and the associated human health considerations embodied in the proposed rule.

Sincerely,

Bill Thompson
Chairman, NTAA

Memo to: EPA Docket (EPA-HQ-OAR-2008-0218)

From: Anthony Nesky, EPA/OAR/ORIA/RPD

Subject: Request for a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule."

On June 10, 2014, Jennifer Thurston of INFORM Colorado called Anthony Nesky of the EPA Radiation Protection Division (RPD) in the Office of Radiation and Indoor Air (ORIA), in the Office of Air and Radiation (OAR), at the U.S. Environmental Protection Agency (EPA) to request a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule," 79 Fed. Reg. 25,388 (May 2, 2014), which proposes revisions to 40 CFR Part 61, Subpart W. Ms. Thurston explained that she was requesting the public hearing on behalf of a number of organizations who wanted public hearings in multiple locations.

Re: Request for Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick:

REQUEST FOR EXTENSION OF TIME TO SUBMIT COMMENTS

Uranium Watch requests a 60-day extension of the time period to submit comments on the Environmental Protection Agency's (EPA's) Proposed Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings, 49 C.F.R. Part 61 Subpart W, Docket ID No. EPA–HQ– OAR–2008–0218. 79 Fed. Reg. 25388, May 2, 2014.

The request for a 60-day extension of time is based on the following.

Proposed Subpart W Factual Bases: One of the EPA's primary reasons for the proposed elimination of the requirement for radon monitoring and reporting at "existing" mill tailings impoundments (as defined in 40 C.F.R. § 61.251(d)) is the claim that the existing tailings impoundment at the Shootaring Canyon Mill (Garfield County, Utah) has a "synthetic liner." This claim is not supported by a citation in the proposed rule or

documentation in the Rulemaking Docket. The fact is that the tailings impoundment for the Shootaring Canyon Mill has a clay liner, not a synthetic liner.[1] This reality means that the EPA has a very shaky factual basis for its determination that, soon, any "existing" conventional tailings impoundments will all meet the standard in 10 C.F.R. § 61.252(b)(1), and, therefore, it is appropriate to eliminate any requirement for radon monitoring at "existing" tailings impoundments.

This incorrect factual claim regarding the Shootaring Canyon Mill and other misinformation, misleading information, incomplete information, and outdated information require a commenter to carefully review the proposed rule and supporting documents. Also, the EPA has asked for commenters' thoughts on various aspects of the proposed rule. These lengthy and detailed research and comment preparations require additional time in order to frame informed comments.

REQUEST FOR HEARING

I would also request a hearing on Subpart W rulemaking at White Mesa, San Juan County. I will be out of state from mid-June until the week of July 27, so request a hearing at White Mesa after July 27, 2014. Therefore, additional time for comments and hearings are necessary.

Thank you for consideration of this request.

Sincerely,

Sarah Fields

To: Rosnick, Reid
Cc: Nesky, Anthony; Group A-AND-R-DOCKET
Subject: Amended Hearing Request and Request for Records

Dear Mr. Rosnick,

This is to amend my request for extension of time for the public to submit comments on the 40 CFR Part 16 Subpart W Rulemaking. I request a 120-day extension of time.

I have also realized that there are no Section 114 Letters/Responses for facility information for the Kennecott Sweetwater Mill. If the EPA is going to make assertions regarding the Sweetwater Mill, the documentation to support those assertions must be available to the public on the Rulemaking Docket and EPA Subpart W webpage.

Also, the EPA Background Information Document and the Risk Assessments refer to various other documents. However, there is scant information regarding public access to these records, and the EPA has not posted these documents to the EPA Subpart W Website.

A 120-day extension of time to submit comments will give the EPA time to request pertinent information from Uranium One, Energy Fuels, and Kennecott and make those responses and the documents referenced in the BID and Rick Assessments available to the public and for the public to review the documents in order to frame comments.

Thank you for your consideration of this request,

Sarah Fields
Program Director

Subpart W Rulemaking Activity

Get e-mail updates when this information changes.

NESHAP Subpart W is a radon emission standard for operating uranium mill tailings. In accordance with the Clean Air Act Amendments of 1990, EPA formed a workgroup to review the standard.

EPA will provide up-to-date information on recent or upcoming conference calls, resources, public hearings and contact information. Please check back regularly, as more items will be added.

Requests for a Public Hearing

EPA has received two requests for a public hearing on the proposed rulemaking for NESHAP Subpart W. EPA plans to conduct a public hearing in response to these requests. The Agency is currently planning the public hearing and will post the information regarding the public hearing (dates, location, times, registration information, etc.) on this website as soon as it has been finalized. Interested parties should check this website for updates.

Requests for Extension of the Public Comment Period

EPA has received two requests for EPA to extend the public comment period for the proposed rulemaking for NESHAP Subpart W. The public comment period currently ends on July 31, 2014. The requestors have asked EPA to extend the public comment period by 120 days. EPA plans to extend the public comment period in response to these requests but has not yet determined the length of that extension. EPA will publish a Federal Register notice when it finalizes its decision regarding the extension of the public comment period. EPA will also post information regarding the extension of the public comment period on this website as soon as it has been finalized. Interested parties should check this website for updates.

- Request from NTAA (PDF) (1 pp, 32.4 KB About PDF)

EPA is proposing revisions to Subpart W. Comment period is open.

"National Emission Standards for radon emissions from Operating Uranium Mill Tailings," Subpart W of 40 CFR Part 61. The proposed rule would require the use of generally available control technology (GACT) to limit radon emissions from tailings at all uranium recovery facilities. Specific control technologies would be required at conventional tailings impoundments, evaporation ponds and heap leach piles. The public is invited to submit comments on the proposed rulemaking. The docket (EPA-HQ-OAR-2008-0218) for this proposed rulemaking may be accessed at Regulations.gov. Once in the docket, you can view the proposed rule and supporting documents. The public comment period currently ends on July 31, 2014. EPA plans to extend the public comment period.

If anyone contacts EPA requesting to speak at a public hearing concerning this proposed rule by July 1, 2014, we will hold a public hearing. If you are interested in attending the public hearing, contact Mr. Anthony Nesky at (202) 343-9597 to verify that a hearing will be held and if you wish to speak. If a public hearing is held, we will announce the date, time and venue on our website at http://www.epa.gov/radiation.

Mine Location Database

EPA worked with the multi-agency Colorado Plateau Data Coordination Group Steering Committee to develop a geographic information database on uranium mines and mills. (The Agency also coordinated this effort with federal, state, and tribal agencies in other parts of the western U.S.)

The database identifies and shows the location of active and inactive uranium mines and mills, as well as mines which principally produced other minerals, but were known to have uranium in the ore. The database covers mine locations in fourteen western states. It also contains other information about the sites. Originally compiled as an important component of the uranium mining technical reports currently being developed, the database was reviewed and checked for its quality to eliminate duplicate and erroneous sites, and subjected to EPA's scientific peer review process.

The database and descriptive materials about its content are now available.

Subpart W Rulemaking Activity

Get e-mail updates when this information changes.

NESHAP Subpart W is a radon emission standard for operating uranium mill tailings. In accordance with the Clean Air Act Amendments of 1990, EPA formed a workgroup to review the standard.

EPA will provide up-to-date information on recent or upcoming conference calls, resources, public hearings and contact information. Please check back regularly, as more items will be added.

Requests for a Public Hearing

EPA has received two requests for a public hearing on the proposed rulemaking for NESHAP Subpart W. EPA plans to conduct a public hearing in response to these requests. The Agency is currently planning the public hearing and will post the information regarding the public hearing (dates, location, times, registration information, etc.) on this website as soon as it has been finalized. Interested parties should check this website for updates.

- Memo to Docket on Telephone Request for Public Hearing (PDF) (1 pp, 196 KB About PDF)
- Letter from Uranium Watch (PDF) (1 pp, 42.9 KB About PDF)

Requests for Extension of the Public Comment Period

EPA has received two requests for EPA to extend the public comment period for the proposed rulemaking for NESHAP Subpart W. The public comment period currently ends on July 31, 2014. The requestors have asked EPA to extend the public comment period by 120 days. EPA plans to extend the public comment period in response to these requests but has not yet determined the length of that extension. EPA will publish a Federal Register notice when it finalizes its decision regarding the extension of the public comment period. EPA will also post information regarding the extension of the public comment period on this website as soon as it has been finalized. Interested parties should check this website for updates.

- Request from Uranium Watch (PDF) (2 pp, 58.9 KB About PDF)

- Request from NTAA (PDF) (1 pp, 32.4 KB About PDF)

EPA is proposing revisions to Subpart W. Comment period is open.

"National Emission Standards for radon emissions from Operating Uranium Mill Tailings," Subpart W of 40 CFR Part 61. The proposed rule would require the use of generally available control technology (GACT) to limit radon emissions from tailings at all uranium recovery facilities. Specific control technologies would be required at conventional tailings impoundments, evaporation ponds and heap leach piles. The public is invited to submit comments on the proposed rulemaking. The docket (EPA-HQ-OAR-2008-0218) for this proposed rulemaking may be accessed at Regulations.gov. Once in the docket, you can view the proposed rule and supporting documents. The public comment period currently ends on July 31, 2014. EPA plans to extend the public comment period.

If anyone contacts EPA requesting to speak at a public hearing concerning this proposed rule by July 1, 2014, we will hold a public hearing. If you are interested in attending the public hearing, contact Mr. Anthony Nesky at (202) 343-9597 to verify that a hearing will be held and if you wish to speak. If a public hearing is held, we will announce the date, time and venue on our website at http://www.epa.gov/radiation.

Conference Call Information

EPA will hold quarterly conference calls with interested stakeholders. The next conference call will occur on **Thursday, July 3, 2014 at 11 AM EDT, 10am CDT, 9am MDT and 8am PDT. The call in number is 1-866-299-3188.** You will be prompted for a conference code, which will be 2023439563. After entering the conference code press the # key and you will then be placed into the conference call.

Historical Rulemakings

April 6 1983 Proposed Rule (17 pp, 2.33 MB), April 1983
This is a 1983 proposal for regulating hazardous air pollutants.

40 CFR Part 61 192.32 a (2 pp, 287 K), October 1983
These are the operating standards for uranium recovery facilities (Subpart W).

October 31 1984 ANPR Radionuclides (13 pp, 1.85 MB), October 1984
This document is EPA's advance notice of a proposed rulemaking concerning radionuclides in 1984.

40 CFR Part 61 General Requirements (4 pp, 594 K), November 1985
These are the general operating and permitting requirements for NESHAP facilities.

Geotechnical & Geohydrological Aspects of Waste Management (3 pp, 428 K) February 1986
Surface water hydrology considerations in predicting radon releases from water-covered areas of uranium tailings ponds.

Background Information Document for Final Rule for Radon-222 Emissions from Licensed Uranium Mill Tailings (224 pp, 6.25 MB), [EPA 520-1-86-009], August 1986
This is the background information used to make the determination on the Subpart W rule.

September 24 1986 Final Rule (13 pp, 3.17 MB), September 1986
This is a 1986 rule that establishes work practices at uranium tailings facilities.

Draft EIS Statement for Proposed NESHAPS for Radionuclides (260 pp, 7.76 MB), [EPA 520-1-89-005], February 1989
This document is a draft of the original 1989 environmental impact statement for the 1989 NESHAP rulemaking.

March 7 1989 Proposed Rule (58 pp, 8.19 MB). March 1989
This is a proposed rule for the NESHAP requirements.

Risk Assessments Methodology, EIS, NESHAPS for Radionuclides (1) (278 pp, 12,433 K), [EPA 520-1-89-005], September 1989
This is the environmental impact statement for the 1989 NESHAP rulemaking.

Risk Assessments Methodology, EIS, NESHAPS for Radionuclides (2) (378 pp, 27 MB), [EPA 520-1-89-006-2], September 1989
This is the environmental impact statement for the 1989 NESHAP rulemaking.

Risk Assessments Methodology, EIS, NESHAPS for Radionuclides (3) (575 pp, 1 2MB), [EPA 520-1-89-007], September 1989
This is the environmental impact statement for the 1989 NESHAP rulemaking.

December 15 1989 Final Rule (63 pp, 9.25 MB), December 1989
This is the final rule for regulating hazardous air pollutants using NESHAP.

Method 115 (3 pp, 443 K), December 1989
This is the monitoring method which must be used to determine radon emissions for Subpart W.

Subpart T Rescission (24 pp, 3.38 MB), December 1991
This document describes how EPA's uranium tailings disposal standards apply to the Department of Energy.

40 CFR Part 61 192.32 a Errata (1 pg, 131 K), November 1993
This rule replaces some language from the original operating standards for uranium recovery facilities (Subpart W).

40 CFR Part 61 General Requirements Errata (2 pp, 312 K), March 1994
This rule replaces some language from the original general operating and permitting requirements.

EPA Procedures for Determining Confidential Business Information (9 pp, 96.9 K), July 1995
This document describes the process EPA uses to determine if information is confidential business information, for purposes of the Freedom of Information Act (FOIA).

October 17 2000 Errata (1 pg, 127 K), October 2000
This document clarifies some test method and procedures language.

NRC's In-Situ Leach Facility Standard Review Plan (255 pp, 193 MB), June 2003
This NRC document provides guidance to NRC staff on reviewing applications to develop and operate uranium recovery facilities.

IAEA Uranium Mill Tailings Report (309 pp, 7.30 MB), August 2004
This document details international efforts to ensure long-term stabilization of uranium mill tailing.

EPA Contract number EP-D-05-002 (103 pp, 10.9 MB), November 2004
This document is the contract between EPA Office of Radiation and Indoor Air and S. Cohen and Associates. Note that this contract expires on March 26, 2010.

Construction of an Environmental Radon Monitoring System using CR-39 Nuclear Track Detectors (6 pp, 746. K) December 2004

National Tribal Air Association
P.O. Box 15004
Flagstaff, AZ 86011-5004

June 13, 2014

Reid J. Rosnick
Office of Radiation and Indoor Air
Radiation Protection Division
U.S. Environmental Protection Agency
Via email to rosnick.reid@epa.gov

Dear Mr. Rosnick,

The National Tribal Air Association (NTAA) is an autonomous organization with 80 principal member Tribes. The organization's mission is to advance air quality management policies and programs, consistent with the needs, interests, and unique legal status of Indian Tribes. As such, the NTAA uses its resources to support the efforts of all federally recognized Tribes in protecting and improving the air quality within their respective jurisdictions.

On behalf of the NTAA, I am writing to request that EPA extend the public comment period for the proposed rule issued in the Federal Register on May 2, 2014, which would revise Subpart W of 40 CFR Part 61, "*National Emission Standards for Operating Uranium Mill Tailings*". Specifically, the *NTAA is requesting the maximum comment extension period of 120 days*.

This rule addresses both conventional uranium milling operations as well as future extraction activities, namely in-situ leach/recovery (ISL) sites. Domestic uranium milling and mining operations to date have left in their wake a disturbing legacy of environmental injustice in Indian Country. As a national organization whose mission it is to advance air quality management and policies for federally recognized Tribes, it is only prudent that NTAA thoroughly evaluate the consequences of the proposed rule, including the potential impacts on Tribal communities, and subsequently provide comments to EPA. Given the serious complexity of the proposed rule, as well as the wide ranging implications for affected Tribes, we strongly request that you grant the aforementioned extension.

For our part, NTAA was only made aware of the proposed rule within the last two weeks. The public comment extension will help to promote a just and equitable public participation process by giving the NTAA, member Tribes, and those Tribes indicated on EPA's consultation list adequate time to examine the complex science and the associated human health considerations embodied in the proposed rule.

Sincerely,

Bill Thompson
Chairman, NTAA

Memo to: EPA Docket (EPA-HQ-OAR-2008-0218)

From: Anthony Nesky, EPA/OAR/ORIA/RPD

Subject: Request for a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule."

On June 10, 2014, Jennifer Thurston of INFORM Colorado called Anthony Nesky of the EPA Radiation Protection Division (RPD) in the Office of Radiation and Indoor Air (ORIA), in the Office of Air and Radiation (OAR), at the U.S. Environmental Protection Agency (EPA) to request a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule," 79 Fed. Reg. 25,388 (May 2, 2014), which proposes revisions to 40 CFR Part 61, Subpart W. Ms. Thurston explained that she was requesting the public hearing on behalf of a number of organizations who wanted public hearings in multiple locations.

Re: Request for Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick:

REQUEST FOR EXTENSION OF TIME TO SUBMIT COMMENTS

Uranium Watch requests a 60-day extension of the time period to submit comments on the Environmental Protection Agency's (EPA's) Proposed Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings, 49 C.F.R. Part 61 Subpart W, Docket ID No. EPA–HQ– OAR–2008–0218. 79 Fed. Reg. 25388, May 2, 2014.

The request for a 60-day extension of time is based on the following.

Proposed Subpart W Factual Bases: One of the EPA's primary reasons for the proposed elimination of the requirement for radon monitoring and reporting at "existing" mill tailings impoundments (as defined in 40 C.F.R. § 61.251(d)) is the claim that the existing tailings impoundment at the Shootaring Canyon Mill (Garfield County, Utah) has a "synthetic liner." This claim is not supported by a citation in the proposed rule or

documentation in the Rulemaking Docket. The fact is that the tailings impoundment for the Shootaring Canyon Mill has a clay liner, not a synthetic liner.[1] This reality means that the EPA has a very shaky factual basis for its determination that, soon, any "existing" conventional tailings impoundments will all meet the standard in 10 C.F.R. § 61.252(b)(1), and, therefore, it is appropriate to eliminate any requirement for radon monitoring at "existing" tailings impoundments.

This incorrect factual claim regarding the Shootaring Canyon Mill and other misinformation, misleading information, incomplete information, and outdated information require a commenter to carefully review the proposed rule and supporting documents. Also, the EPA has asked for commenters' thoughts on various aspects of the proposed rule. These lengthy and detailed research and comment preparations require additional time in order to frame informed comments.

REQUEST FOR HEARING

I would also request a hearing on Subpart W rulemaking at White Mesa, San Juan County. I will be out of state from mid-June until the week of July 27, so request a hearing at White Mesa after July 27, 2014. Therefore, additional time for comments and hearings are necessary.

Thank you for consideration of this request.

Sincerely,

Sarah Fields

Subject: Amended Hearing Request and Request for Records

Dear Mr. Rosnick,

This is to amend my request for extension of time for the public to submit comments on the 40 CFR Part 16 Subpart W Rulemaking. I request a 120-day extension of time.

I have also realized that there are no Section 114 Letters/Responses for facility information for the Kennecott Sweetwater Mill. If the EPA is going to make assertions regarding the Sweetwater Mill, the documentation to support those assertions must be available to the public on the Rulemaking Docket and EPA Subpart W webpage.

Also, the EPA Background Information Document and the Risk Assessments refer to various other documents. However, there is scant information regarding public access to these records, and the EPA has not posted these documents to the EPA Subpart W Website.

A 120-day extension of time to submit comments will give the EPA time to request pertinent information from Uranium One, Energy Fuels, and Kennecott and make those responses and the documents referenced in the BID and Rick Assessments available to the public and for the public to review the documents in order to frame comments.

Thank you for your consideration of this request,

Sarah Fields
Program Director

Memo to: EPA Docket (EPA-HQ-OAR-2008-0218)

From: Anthony Nesky, EPA/OAR/ORIA/RPD

Subject: Request for a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule."

On June 10, 2014, Jennifer Thurston of INFORM Colorado called Anthony Nesky of the EPA Radiation Protection Division (RPD) in the Office of Radiation and Indoor Air (ORIA), in the Office of Air and Radiation (OAR), at the U.S. Environmental Protection Agency (EPA) to request a public hearing on the proposed rule "Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule," 79 Fed. Reg. 25,388 (May 2, 2014), which proposes revisions to 40 CFR Part 61, Subpart W. Ms. Thurston explained that she was requesting the public hearing on behalf of a number of organizations who wanted public hearings in multiple locations.

Dear Carmen:

Here's the one file that I still owe you for the update to Subpart W. Metadata are as follows—

- *Title: Telephone Request for Hearing on Subpart W Proposed Rulemaking*
  Author: EPA-OAR-ORIA-RPD
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, hearing request.

Do you anticipate any problems getting this update today? Thanks for your help!

Subject: We have to make some changes to the Subpart W page today
Importance: High

Cara Carmen,
We have some changes to the Subpart W page that will need to be posted today. Please post to the staging server so that all parties can review before we finalize.
On:
http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html
Please add the following two sections before the section "EPA is proposing revisions to Subpart W."

Requests for a Public Hearing
EPA has received two requests for a public hearing on the proposed rulemaking for NESHAP Subpart W. EPA plans to conduct a public hearing in response to these requests. The Agency is currently planning the public hearing and will post the information regarding the public hearing (dates, location, times, registration information, etc.) on this website as soon as it has been finalized. Interested parties should check this website for updates.
Requests for a public hearing—

- Memo to Docket on Telephone Request for Public Hearing (PDF
- Letter from Uranium Watch(PDF…)

Requests for Extension of the Public Comment Period
EPA has received two requests for EPA to extend the public comment period for the proposed rulemaking for NESHAP Subpart W. The public comment period currently ends on July 31, 2014. The requestors have asked EPA to extend the public comment period by 120 days. EPA plans to extend the public comment period in response to these requests but has not yet determined the length of that extension. EPA will publish a Federal Register notice when it finalizes its decision regarding the extension of the public comment period. EPA will also post information regarding the extension of the public comment period on this website as soon as it has been finalized. Interested parties should check this website for updates.
Requests for an extension of the public comment period—

- Request from Uranium Watch (PDF….)
- Request from NTAA (PDF..)

Note to Carment All of the PDF files for the above are attached, except for the Memo to the Docket, which I am still working on.

Metadata for the PDF files are as follows--

- *File: Uranium WatchHearingRequest-6-10-14*
  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: Uranium Watch
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, hearing request.

- *File: Uranium WatchExtensionRequest-6-12-14*
  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: Uranium Watch
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, comment period extension request.

  Title: Public Hearing Request for Subpart W Proposed Rulemaking
  Author: NTAA
  Subject: National Emission Standards, NESHAP, Proposed Rulemaking
  Keywords: Subpart W, proposed rulemaking, comment period extension request.

After inserting the two sections above, please change the next section as follows--

EPA is proposing revisions to Subpart W. Comment period is open.

“National Emission Standards for radon emissions from Operating Uranium Mill Tailings,” Subpart W of 40 CFR Part 61. The proposed rule would require the use of generally available control technology (GACT) to limit radon emissions from tailings at all uranium recovery facilities. Specific control technologies would be required at conventional tailings impoundments, evaporation ponds and heap leach piles. The public is invited to submit comments on the proposed rulemaking. The docket (EPA-HQ-OAR-2008-0218) for this proposed rulemaking may be accessed at Regulations.gov. Once in the docket, you can view the proposed rule and supporting documents . The public comment period currently ends on July 31, 2014 . EPA plans to extend the public comment period

Reid J. Rosnick
Office of Radiation and Indoor Air
Radiation Protection Division
U.S. Environmental Protection Agency
Via email to rosnick.reid@epa.gov

Dear Mr. Rosnick,

The National Tribal Air Association (NTAA) is an autonomous organization with 80 principal member Tribes. The organization's mission is to advance air quality management policies and programs, consistent with the needs, interests, and unique legal status of Indian Tribes. As such, the NTAA uses its resources to support the efforts of all federally recognized Tribes in protecting and improving the air quality within their respective jurisdictions.

On behalf of the NTAA, I am writing to request that EPA extend the public comment period for the proposed rule issued in the Federal Register on May 2, 2014, which would revise Subpart W of 40 CFR Part 61, "*National Emission Standards for Operating Uranium Mill Tailings*". Specifically, the *NTAA is requesting the maximum comment extension period of 120 days*.

This rule addresses both conventional uranium milling operations as well as future extraction activities, namely in-situ leach/recovery (ISL) sites. Domestic uranium milling and mining operations to date have left in their wake a disturbing legacy of environmental injustice in Indian Country. As a national organization whose mission it is to advance air quality management and policies for federally recognized Tribes, it is only prudent that NTAA thoroughly evaluate the consequences of the proposed rule, including the potential impacts on Tribal communities, and subsequently provide comments to EPA. Given the serious complexity of the proposed rule, as well as the wide ranging implications for affected Tribes, we strongly request that you grant the aforementioned extension.

For our part, NTAA was only made aware of the proposed rule within the last two weeks. The public comment extension will help to promote a just and equitable public participation process by giving the NTAA, member Tribes, and those Tribes indicated on EPA's consultation list adequate time to examine the complex science and the associated human health considerations embodied in the proposed rule.

Sincerely,

Bill Thompson
Chairman, NTAA

Re: Request for Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick:

REQUEST FOR EXTENSION OF TIME TO SUBMIT COMMENTS

Uranium Watch requests a 60-day extension of the time period to submit comments on the Environmental Protection Agency's (EPA's) Proposed Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings, 49 C.F.R. Part 61 Subpart W, Docket ID No. EPA–HQ– OAR–2008–0218. 79 Fed. Reg. 25388, May 2, 2014.

The request for a 60-day extension of time is based on the following.

Proposed Subpart W Factual Bases: One of the EPA's primary reasons for the proposed elimination of the requirement for radon monitoring and reporting at "existing" mill tailings impoundments (as defined in 40 C.F.R. § 61.251(d)) is the claim that the existing tailings impoundment at the Shootaring Canyon Mill (Garfield County, Utah) has a "synthetic liner." This claim is not supported by a citation in the proposed rule or

documentation in the Rulemaking Docket. The fact is that the tailings impoundment for the Shootaring Canyon Mill has a clay liner, not a synthetic liner.[1] This reality means that the EPA has a very shaky factual basis for its determination that, soon, any "existing" conventional tailings impoundments will all meet the standard in 10 C.F.R. § 61.252(b)(1), and, therefore, it is appropriate to eliminate any requirement for radon monitoring at "existing" tailings impoundments.

This incorrect factual claim regarding the Shootaring Canyon Mill and other misinformation, misleading information, incomplete information, and outdated information require a commenter to carefully review the proposed rule and supporting documents. Also, the EPA has asked for commenters' thoughts on various aspects of the proposed rule. These lengthy and detailed research and comment preparations require additional time in order to frame informed comments.

REQUEST FOR HEARING

I would also request a hearing on Subpart W rulemaking at White Mesa, San Juan County. I will be out of state from mid-June until the week of July 27, so request a hearing at White Mesa after July 27, 2014. Therefore, additional time for comments and hearings are necessary.

Thank you for consideration of this request.

Sincerely,

Sarah Fields

Subject: Amended Hearing Request and Request for Records

Dear Mr. Rosnick,

This is to amend my request for extension of time for the public to submit comments on the 40 CFR Part 16 Subpart W Rulemaking. I request a 120-day extension of time.

I have also realized that there are no Section 114 Letters/Responses for facility information for the Kennecott Sweetwater Mill. If the EPA is going to make assertions regarding the Sweetwater Mill, the documentation to support those assertions must be available to the public on the Rulemaking Docket and EPA Subpart W webpage.

Also, the EPA Background Information Document and the Risk Assessments refer to various other documents. However, there is scant information regarding public access to these records, and the EPA has not posted these documents to the EPA Subpart W Website.

A 120-day extension of time to submit comments will give the EPA time to request pertinent information from Uranium One, Energy Fuels, and Kennecott and make those responses and the documents referenced in the BID and Rick Assessments available to the public and for the public to review the documents in order to frame comments.

Thank you for your consideration of this request,

Sarah Fields

UTE MOUNTAIN UTE TRIBE'S INITIAL QUESTIONS
Environmental Protection Agency, Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings, Proposed Rule
40 C.F.R. Part 61
Submitted on June 13, 2014 in preparation for government-to-government consultation, July 10, 2014

I. EPA, INDIAN TRIBES, AND EXECUTIVE ORDER 13175

1. The Environmental Protection Agency's (EPA) statement regarding compliance with Executive Order 13175 states that the Subpart W rulemaking action does not have "tribal implications" because the rulemaking does not impose regulatory requirements on tribal governments. Please be prepared to discuss how the following issues impact the EPA's Executive Order 13175 analysis:

   - Although Native Americans make up only 1.4 percent of Utah's racial profile (and 0.9 percent of the United States' racial profile), they make up 55.8 percent of the racial profile for San Juan County, Utah (the county where the White Mesa Mill (WMM) is located).
   - The WMM facility is located on aboriginal lands of the Ute Mountain Ute Tribe.
   - The WMM facility is located adjacent to land and other Indian Trust Assets held in trust by the United States on behalf of the Ute Mountain Ute Tribe (and less than 3 miles from the nearest Tribal resident).
   - The Tribal community located in White Mesa is downgradient of the WMM facility.
   - The Tribal community located in White Mesa is completely dependent on groundwater supplies located underneath the WMM facility and tailings cells.
   - Activities and operations at the WMM have already impacted Tribal members' abilities to use surface, plant, wildlife, and surface water resources on public and Tribal lands.

2. Please be prepared to discuss how the EPA will address Tribal concerns during this Subpart W rulemaking and related rulemaking processes (including, but not limited to, the anticipated revision to 40 C.F.R. Part 192).

3. Please be prepared to discuss how or whether the EPA undertook analysis of how this rulemaking will impact UMU Tribal members, UMU Tribal lands, and Indian Trust Assets.

II. NESHAPS/CLEAN AIR ACT QUESTIONS

4. Has the EPA evaluated establishing a lesser quantity or different criteria for major sources of radionuclides under Section 112(a)(1) of the CAA? *See* footnote 2, page 25390 of the proposed rulemaking (noting that *none* of the uranium recovery facilities are major sources under NESHAPS).

5. On page 25390 of the proposed rulemaking, the EPA identifies the "source category" for Subpart W using 40 C.F.R. § 61.250 and the proposed definition of "uranium recovery facility." Has the EPA listed uranium recovery facilities as a category or subcategory of sources under Section 112(c) of the Clean Air Act? If so, please provide an explanation and documentation in advance of the consultation meeting.

6. On page 25390 of the proposed rulemaking, the EPA states, "Subpart W requirements specifically apply to the affected sources at the uranium recovery facilities that are used to manage or contain the uranium byproduct material or tailings." However, the proposed Subpart W rulemaking only covers some HAP sources at uranium recovery facilities, and not others (such as stackhouses, ore pad, ore grinder, and the Mill yard, see Question 7, *infra*). Please explain the EPA's rationale for excluding such HAP sources at conventional uranium mills.

7. On page 25390 of the proposed rulemaking, the EPA states: "We presently have no data or information that shows any other HAPs being emitted from these impoundments." Please provide a response to the following initial questions, data, and information regarding other HAPs that may be emitted from the WMM.

    - The WMM's 10 C.F.R. § 40.65 environmental airborne particulate monitoring program monitors for natural uranium (Uranium-238, Uranium-234, Uranium-235), Thorium-230, Radium-226, and Lead-210. This air monitoring program has detected all four isotopes at all of the air monitoring stations. Additionally, the WMM has identified Lead-210, Thorium-230, Thorium-232, Polonium-210, Radium-226, and Radium-228 in wastewater samples from the tailings impoundments. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
    - The WMM processes uranium ore. During the uranium storage and milling processes, there may be more than three dozen radioactive isotopes present at the WMM facility (including actinium, astatine, bismuth, francium, lead, polonium, protactinium, radium, radon, thallium, thorium, and uranium). *See* Uranium Decay Series diagram on page 44 of the Technical and Regulatory Support document. This indicates that sources at the WMM (including the tailings impoundments, stackhouses, ore pad, ore grinder, and the Mill yard) are emitting radionuclides other than Radon-222.
    - The WMM's uranium milling process uses significant quantities of chemicals (sodium chlorate is used during ore oxidation; sulfuric acid and flocculants are used during the leaching and clarification; secondary amines/kerosene, tri-alkyl amines/tributyl phosphate modifier, and quaternary ammonium compounds/alcohol are used during the solvent extraction; chlorides and sulfates are used during pregnant liquor stripping; and ammonia hydroxide and sodium hydroxide during yellowcake precipitation). During the storage and use of these chemicals, and after these chemicals are disposed in the tailings impoundments, there may be significant emissions of HAPs at the WMM.

- The WMM processes alternate feed materials. During the alternate feed storage and milling processes, other radioactive isotopes, non-metal compounds, and other regulated HAPs may be emitted from the WMM.
- The WMM processes vanadium ore. Vanadium is considered to be dangerous to life and health by both the Occupational Safety and Health Administration and the National Institute for Occupational Safety and Health, and may be listed as a HAP in the future. The WMM's vanadium recovery process uses a significant quantity of chemicals (sodium chlorate is used during the redox/pH adjustment; kerosene and secondary amines are used during the solvent extraction; soda ash is used during the vanadium pregnant liquor stripping process; and ammonia hydroxide is used during the vanadium precipitation). This indicates that the vanadium recovery process results in the emission of HAPs other than Radon-222 from the WMM facility.

8. On page 25390 of the proposed rulemaking, the EPA states that it evaluated the MACT standards applicable to major sources in the same industrial sector. Please provide the Tribe with this analysis prior to the consultation, and be prepared to explain the MACT analysis that the EPA performed during this rulemaking process.

9. Please explain how the EPA evaluated the use of a work practice standard, rather than an emissions standard, for the control of a HAP under the proposed rulemaking. *See* Section 112(h), Clean Air Act. Please specifically address the EPA's determination to remove the current emissions standard for existing impoundments. Please also explain how removing the emissions standard from Subpart W will affect: (a) how the WMM facility sets and meets the ALARA goal to protect worker and adjacent communities from radionuclides; and (b) monitoring of radon emissions under 10 C.F.R. Part 40, Appendix A.

III. SUBPART W AND CLOSURE OF LEGACY IMPOUNDMENTS

10. In 1989, when the EPA proposed the current Subpart W NESHAP, the EPA concluded that, "Existing mill tailing piles are large piles of waste that emit radon. There is nothing that can be done to reduce the amount of radon they emit except cover them." 54 FR 9644 (March 7, 1989). EPA crafted Subpart W to prohibit uranium mills from having more than two tailings impoundments in operation. Explain why the EPA has not required closure of the legacy Tailings Cells 1, 2, and 3 at the WMM, as contemplated and required by the current NESHAP.

11. In this proposed rulemaking, the EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Explain how the EPA can justify the long-term risk of having almost 300 acres of tailings impoundments that are either in operation or in closure but without a permanent radon barrier at the WMM. *See also* questions on conventional and non-conventional impoundments.

IV. DEFICIENT OR INCORRECT ANALYSIS OF OPERATIONS AND FACILITIES AT THE WMM

12. The owners of the WMM state in the June 1, 2009 letter response to EPA's CAA Section 114 Information Request that Tailings Cells 1, 2, and 3 meet the requirements of 40 C.F.R. 192.32(a). The WMM owners specify that these specific Tailings Cells meet the design and operating requirements under 40 C.F.R. 264.221(a). Please explain how the EPA evaluated the WMM owners' assertions regarding compliance with 40 C.F.R. 192.32(a) and 40 C.F.R. 264.221(a), given the following:
    - The liners in Tailings Cells 1, 2, and 3 were designed for a 15-year life and were installed between May 1980 and September 1982. These impoundments have already been in operation for over 30 years.
    - Contamination of the shallow groundwater underlying Tailings Cells 1, 2, and 3 has been documented and is the subject of investigation and corrective action to address elevated chloroform, nitrate and chlorides. There is significant evidence that the liners on Tailings Cells 1, 2, and 3 have already allowed migration of waste out of the impoundments into the adjacent groundwater.
    - The Agreement State and the WMM owners treat the shallow groundwater aquifer under the WMM facility as the leak detection system for Tailings Cells 1, 2, and 3 (and developed a groundwater monitoring program that can detect tailings cell leakage only after waste has migrated out of these legacy impoundments).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 do not have appropriate chemical properties and sufficient strength and thickness to prevent failure due to conditions outlined in 40 C.F.R. § 264.221(a)(1).
    - The single, 30-mil PVC liners in Tailings Cells 1, 2, and 3 are not compatible with alternate feed materials contained in the impoundments.

13. Several important sections of the proposed rulemaking rely on the provisions of 40 C.F.R. § 264.221(c) (and not 40 C.F.R. § 264.221(a)) to explain protection of groundwater or other environmental analysis. *See, e.g.*, page 25393 (setting forth specific liner requirements from 40 C.F.R. § 264.221(c)); page 25397 (specifically relying on safeguards from a leak detection system); page 25401 (specifying that the proposed GACT is for double liners on non-conventional impoundments). The provisions of 40 C.F.R. § 264.221(c) are significantly more protective of groundwater, human health, and the environment.

    - Is the EPA taking the position that all conventional impoundments and non-conventional impoundments must meet the requirements of 40 C.F.R. § 264.221(c)? If so, please clarify the EPA's position on whether Tailings Cells 1, 2, and 3 at the WMM meet the requirements of 40 C.F.R. § 264.221(c).

    - If the EPA is <u>not</u> taking the position that 40 C.F.R § 264.221(c) applies to all conventional and non-conventional impoundments, please explain how the EPA addressed risks to groundwater from legacy impoundments like Tailings Cells 1,

2, and 3. Please specifically address how the EPA assessed the risk of groundwater contamination from Tailings Cell 1. *See* question 12, *supra*.

14. Please explain how (or if) the EPA's specific analysis of the WMM facility addressed the following:

- Cell 2 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
- Method 115 monitoring on Cell 2 detected a Subpart W NESHAPS violation in 2012/2013 over the 20 pCi/m2-s limit.
- Cell 3 is currently licensed to receive 11(e)(2) byproduct material (liquids and solids).
- Cell 3 is currently the only tailings cell at the WMM that receives certain forms of 11(e)(2) byproduct material (materials trucked in, including ISL waste).
- The WMM facility has not historically operated its "conventional" and "non-conventional" tailings impoundments separately. Tailings Cell 4A was operated as a "non-conventional" impoundment, which resulted in surface and groundwater contamination until the cell was retrofitted starting in 2008. Tailings Cell 4B is currently operated as a "non-conventional" impoundment, but the WMM owners indicate that it will be used as a "conventional" impoundment in the future.
- Under currently approved and proposed reclamation plans for the WMM, the permanent radon barriers will not be placed on *any* tailings impoundments until final reclamation at the facility.

V. NON-CONVENTIONAL IMPOUNDMENTS

15. How did the EPA develop the proposed definition of "non-conventional impoundments"?

16. Please explain how the EPA will distinguish between conventional and non-conventional impoundments.

    a. Is there a minimum amount of liquid that must be present in the pond for the EPA to classify a tailings impoundment as a non-conventional impoundment, or can a facility owner convert a conventional impoundment into a non-conventional impoundment by adding the minimum 1m of liquid on the top of the impoundment?

    b. Will the final reclamation or removal plan for a tailings impoundment determine whether it qualifies as a "non-conventional impoundment"?

        - Please explain how the EPA will treat Tailings Cell 1 at the WMM (noting that the WMM owners plan to remove solids from the cell upon final reclamation, but then permanently dispose of debris from the Mill facilities and contaminated soil in the cell). *See* June 1, 2009 Response Letter at 6; page 25405 of the proposed rulemaking (addressing the disposal of byproduct material like deconstruction material during facility reclamation).

- Please explain how the EPA will treat Tailings Cell 4B at the WMM (which the WMM owner is currently operating as a non-conventional impoundment, but which will become a conventional impoundment before final reclamation).

17. The WMM is currently authorized to temporarily place liquid 11(e)(2) byproduct material in "Roberts Pond" (before pumping the liquid into Tailings Cells 1 and 4B). Does Roberts Pond meet the proposed definition of a "non-conventional impoundment"? *See* pages 25390, 25393 of the proposed rulemaking (addressing "holding" and "collection" ponds). Please explain how EPA has assessed the Radon-222 emissions from Roberts Pond and from the regular transfer of process water from Roberts Pond to Tailings Cells 1 and 4B.

18. Please explain the EPA's rationale for allowing non-conventional impoundments to exist until removal at facility closure.

    - Did the EPA analyze whether allowing water-covered impoundments to exist for the life of a facility increases risks of groundwater and surface water contamination? Please see question 12 (and explain EPA's position on the 15-year design life for Tailings Cell 1 at the WMM).
    - How will the EPA ensure that non-conventional impoundments are periodically retrofitted to ensure that the impoundments do not contaminate groundwater and surface water?

19. EPA acknowledges that there is a linear relationship between the area of a tailings impoundment and Radon-222 emissions (which justifies the size restrictions on conventional impoundments). *See* page 25393 of the proposed rulemaking. Please explain why this linear relationship does not also justify size restrictions on non-conventional impoundments (and please specifically address how this linear relationship will impact Radon-222 emissions when large non-conventional impoundments are dewatered and closed).

20. How has the EPA analyzed what risks non-conventional impoundments (including large non-conventional impoundments like Tailings Cell 1 at the WMM) will pose to human health and the environment when they are de-watered and decommissioned?

21. How will the proposed rule address tailings impoundments that are used as conventional and non-conventional impoundments (such as Tailings Cells 4A and 4B at the WMM)? How will the EPA "count" these cells using the 2-cell limit in the conventional impoundment work practice standard?

22. The EPA's analysis that using liquids to cover tailings cells "has been sufficient to limit the amount of radon emitted from the ponds, in many cases, to almost zero" is insufficient to demonstrate that Tailings Cell 1 at the WMM has a radon flux of "almost zero" (or even under 20 pCi/m2-s).

Based on the information and questions below, please provide the EPA's specific analysis of the calculated radon emissions from Tailings Cell 1, Tailings Cell 4B, and Roberts Pond at the WMM. Please then explain how EPA calculates the dose to the White Mesa Tribal community (considering radon emissions from Tailings Cell 1 and 4B and Roberts Pond, along with radon emissions from "conventional" impoundments 2, 3, and 4A).

a. The proposed rulemaking recognizes that covering tailings impoundments with water does not reduce radon emissions to zero. *See, e.g.*, Radon Emission from Evaporation Ponds (noting that the radon flux above some evaporation ponds can be significant/exceed 20 pCi/m2-s).
b. The proposed rulemaking contemplates the use of radium-laden "process water" to provide liquid covers on non-conventional impoundments, but does not address whether the use of radium-laden process water increases the radon emissions from a non-conventional impoundment. The EPA analysis justifying the use of the 1 meter water cover relies on the assumption that the water cover is not laden with radium. The EPA analysis also calculates significant radon flux from non-conventional impoundments containing radium-laden water. Please justify the EPA's position that 1 m of radium-laden process water can decrease radon flux from tailings impoundments like Tailings Cell 1 at WMM to zero.
c. The EPA's analysis of radon emissions from liquid-covered impoundments recognizes that there are significant radon emissions during the transfer of radium-laden waters to and between tailings impoundments and during enhanced evaporation sprays, but it does not calculate or address these emissions for conventional mills like the WMM.
d. Using the radon flux equation contained in Section 4.0 of the Radon Emissions from Evaporation Ponds report along with the actual radium content[1] in Tailings Cell 1, the Tribe's initial calculation on the radon flux from Tailings Cell 1 is 327 pCi/m2-s (not including emissions during transfer into Cell 1 or during enhanced evaporation sprays).

VI. CONVENTIONAL IMPOUNDMENTS

23. The Tribe is generally confused about the EPA's approach to Tailings Cells 2 and 3 at the WMM. The EPA seems to recognize that neither of these tailings cells meets the work practice standards proposed in this rulemaking. *See* page 25395 of the proposed rulemaking (noting that Cell 3 could not meet the work practice standards). Given that both tailings impoundments are still licensed by the Agreement State to receive liquid and solid 11(e)(2) byproduct material and that neither tailings impoundment has a tailings closure plan with milestones for placement of a permanent radon barrier, please explain how the EPA can continue to justify removing the monitoring requirements and emissions limits that currently apply to these impoundments.

[1] To determine the actual radium content, the Tribe used the 32,700 pCi/L Gross Radium Alpha concentration provided in the in the 2013 Annual Tailings Report.

24. The Tribe is concerned that, although Tailings Cell 2 had a recent violation of the 20 pCi/m2-s emissions limit that applies to existing impoundments (and although that violation was detected during monitoring conducted under Method 115), the EPA did not consider Cell 2 when considering how the proposed rulemaking would impact the WMM. Please explain why the EPA omitted any analysis of Cell 2 and the recent Subpart W violation at Cell 2. Please also explain how the EPA will ensure that emissions from Tailings Cell 2 do not exceed 20 pCi/m2-s between now and when the final radon barrier is placed during final reclamation of the entire facility (given that the EPA is proposing to eliminate both the emissions limit and the monitoring to detect Radon-222 emissions over 20 pCi/m2-s).

25. The proposed rulemaking references the use of an "interim cover" on Tailings Cells 2 and 3 at the WMM. The Tribe is concerned that the WMM owners have used this "interim cover" on Tailings Cell 2 for more than a decade (and that the use of this cover has already resulted in Radon-222 emissions of over the 20 pCi/m2-s limit) and that the Reclamation Plan for the WMM contemplates the use of such "interim covers" until final reclamation at the facility. Please explain whether and how the EPA justifies the use of interim covers (and not the immediate placement of permanent radon barriers).

VII. APPLICABILITY OF 40 C.F.R. PART 192

26. A significant portion of the EPA's analysis in the proposed rulemaking (including analysis on impacts to the environment and human health, analysis on weather and other hazards, and economic analysis) rests on the assumption that all tailings impoundments (conventional and non-conventional) meet the standards set forth in 40 C.F.R. § 192.32(a)(1) and 40 C.F.R. § 264.221. How will the EPA ensure that all the tailings impoundments at the WMM facility meet the applicable federal standards?

27. The EPA is proposing to eliminate internal cross references to the sections of 40 C.F.R. Part 192 that cover placement of permanent radon barriers on tailings impoundments. Additionally, although the EPA identified the need to better define "closure" under Subpart W, the revisions to the terms "standby" and "operation" in the proposed rulemaking do not define or address "closure" under the revised Subpart W NESHAP regulations.
    - How will the EPA determine whether a tailings impoundment has entered "final closure" for Subpart W NESHAP purposes?
    - If the EPA no longer intends to utilize other portions of 40 C.F.R. Part 192 (including, but not limited to, the definitions of "Tailings Closure Plan," "Permanent Radon Barrier," and requirements that the permanent radon barrier be constructed as expeditiously as possible and in accordance with a tailings closure plan), how will the EPA ensure that permanent radon barriers are properly placed on tailings cells? Here, please address the Tribe's concern that, under current reclamation plans for the WMM, the permanent radon barriers for Cells 2 and 3 will not be placed under final reclamation of the facility (and that there are no Tailings Closure Plans, as defined in 40 C.F.R. Part 192, with milestones for the expeditious placement of the permanent radon barriers).

28. The Tribe is concerned that the Tribal community in White Mesa will be exposed to elevated levels of Radon-222 when the WMM facility undertakes de-watering or other closure activities or allows Tailings Cells 2 and 3 to remain open under an "interim cover." Please explain how the EPA has specifically assessed the anticipated dose to the White Mesa Community *during* the closure period. Please also explain how the EPA will ensure that Tribal members, Tribal lands and other Indian Trust Assets are not exposed to Radon-222 emissions in excess of 20 pCi/m2-s during the closure period.

Subject: Initial Questions from the UMUT

Dear Reid,

Attached are the initial questions from the UMUT to help the EPA and UMUT prepare for the July 10th consultation meeting. We hope that having a full discussion of these questions in the June 24-26 time period helps to make sure that we can have meaningful dialogue at the July 10th consultation meeting. Please plan accordingly when you put together your team and a time frame for the conference call (we anticipate here that it will take a few hours to get through the 28 questions).

I wanted to reiterate my offer to have a call between now and our June conference call with your EPA attorneys if there are concerns about the exchange of written materials or substantive discussion on any of the points contained in the initial questions list.

Best,

Celene Hawkins
Associate General Counsel

Subject: RE: call next week Tuesday or Wednesday?

Reid,
We are trying to get them finalized tomorrow (Friday) to send, but it may roll into Monday. Perhaps with that in mind we should scratch next Tuesday-Wednesday and aim for the 24-26th time frame. That will still give you a couple weeks before the consultation date to prepare.

Hi Scott,

We would like to have the conference call with you as soon as practicable. However, we would like to have your questions in hand so we can discuss them with you during the call. Can you give me a better idea of when you will be able to transmit your questions? I would like at least a day or two to get them to EPA participants so we can discuss your concerns more effectively. Thanks.

I'll be away from my desk all day, in training, but I will check my email and voice mail at the end of the day. Thanks again.

Reid

Subject: call next week Tuesday or Wednesday?

HI Reid,
We are working on preparing the questions that we will want answers for at the upcoming consultation meeting. We are planning to have those to your team at EPA in the next few days.
We would like to schedule our second pre-consultation call to clarify the questions. We have availability next Tuesday (I can skip out of a little of my ROC meeting if necessary) or Wednesday afternoon. I think we could bump it into the following week, 24-26th but I will need to confirm that with our team. Please consider some dates.
Thanks,
Scott

June 13, 2014

Reid J. Rosnick
Office of Radiation and Indoor Air
Radiation Protection Division
U.S. Environmental Protection Agency
Via email to rosnick.reid@epa.gov

Dear Mr. Rosnick,

The National Tribal Air Association (NTAA) is an autonomous organization with 80 principal member Tribes. The organization's mission is to advance air quality management policies and programs, consistent with the needs, interests, and unique legal status of Indian Tribes. As such, the NTAA uses its resources to support the efforts of all federally recognized Tribes in protecting and improving the air quality within their respective jurisdictions.

On behalf of the NTAA, I am writing to request that EPA extend the public comment period for the proposed rule issued in the Federal Register on May 2, 2014, which would revise Subpart W of 40 CFR Part 61, "*National Emission Standards for Operating Uranium Mill Tailings*". Specifically, the *NTAA is requesting the maximum comment extension period of 120 days*.

This rule addresses both conventional uranium milling operations as well as future extraction activities, namely in-situ leach/recovery (ISL) sites. Domestic uranium milling and mining operations to date have left in their wake a disturbing legacy of environmental injustice in Indian Country. As a national organization whose mission it is to advance air quality management and policies for federally recognized Tribes, it is only prudent that NTAA thoroughly evaluate the consequences of the proposed rule, including the potential impacts on Tribal communities, and subsequently provide comments to EPA. Given the serious complexity of the proposed rule, as well as the wide ranging implications for affected Tribes, we strongly request that you grant the aforementioned extension.

For our part, NTAA was only made aware of the proposed rule within the last two weeks. The public comment extension will help to promote a just and equitable public participation process by giving the NTAA, member Tribes, and those Tribes indicated on EPA's consultation list adequate time to examine the complex science and the associated human health considerations embodied in the proposed rule.

Sincerely,

Bill Thompson
Chairman, NTAA

Just checked. July 21 and 22 are available. Let me know tomorrow so we can finalize the reservation. Am I missing something? I'm not sure what Reid's vacation the week of July 28th has to do with any of the dates.

So again here are the options:

7/21 and 7/22
8/4 and 9/5
9/2 and 9/3
9/3 and 9/4

Subject: FW: Amended Hearing Request and Request for Records

From: sarah@uraniumwatch.org [mailto:sarah@uraniumwatch.org]
Sent: Thursday, June 12, 2014 3:52 PM
To: Rosnick, Reid
Cc: Nesky, Anthony; Group A-AND-R-DOCKET
Subject: Amended Hearing Request and Request for Records

Dear Mr. Rosnick,

This is to amend my request for extension of time for the public to submit comments on the 40 CFR Part 16 Subpart W Rulemaking. I request a 120-day extension of time.

I have also realized that there are no Section 114 Letters/Responses for facility information for the Kennecott Sweetwater Mill. If the EPA is going to make assertions regarding the Sweetwater Mill, the documentation to support those assertions must be available to the public on the Rulemaking Docket and EPA Subpart W webpage.

Also, the EPA Background Information Document and the Risk Assessments refer to various other documents. However, there is scant information regarding public access to these records, and the EPA has not posted these documents to the EPA Subpart W Website.

A 120-day extension of time to submit comments will give the EPA time to request pertinent information from Uranium One, Energy Fuels, and Kennecott and make those responses and the documents referenced in the BID and Rick Assessments available to the public and for the public to review the documents in order to frame comments.

Thank you for your consideration of this request,

Sarah Fields

FYI

From: sarah@uraniumwatch.org [mailto:sarah@uraniumwatch.org]
Sent: Thursday, June 12, 2014 1:25 PM
To: Rosnick, Reid
Cc: Group A-AND-R-DOCKET
Subject: Subpart W Rulemaking Documents

Dear Mr. Rosnick,

The following have become apparent:

1. The EPA did not receive a Clean Air Act (CAA) Section 114 response from Uranium One about the Shootaring Canyon Mill, and maybe did not even request such information. If the EPA had received such information, the EPA would not have made a false and misleading statement about the nature of the Shootaring Canyon tailings impoundment liner in the Subpart W Rulemaking May 2, 2014, *Federal Register* Notice (79 Fed. Reg. 25388).

2. The EPA never received a response from Denison Mines (USA) Corp. to the May 2009 CAA Section 114 letter requesting information about the evaporation ponds at the White Mesa Mill. This is apparent by the lack of information about the evaporation ponds at the White Mesa Mill in the "Risk Assessment Revision for 40 CFR Part 61 Subpart W – Radon Emissions from Operating Mill Tailings; Task 5 – Radon Emission from Evaporation Ponds," by S. Cohen & Associates, November 9, 2010. The evaluation of Radon Emissions from Evaporation Ponds does not reference any Denison Mines communication and does not discuss the White Mesa Mill evaporation ponds. Clearly the EPA contractor did not have the pertinent information before them regarding the White Mesa Mill evaporation ponds.

3. The EPA must request, receive, and post the same information about the Shootaring Canyon Mill that was received for other uranium mills. The EPA must again request that the licensee, now Energy Fuels Resources Inc., provide information about the impoundments at the White Mesa Mill that store processing

liquids. This would include Cells 1 and 4B, Robert's Pond, and the fluids on top of Cells 3 and 4A. This would include data on the radium and other radiological contents of the fluids in these impoundments over time.

4. The EPA must extend the comment period to provide an opportunity for the EPA to obtain this relevant information, make it publicly available, and allow for public review.

5. The EPA should seriously consider withdrawing the May 2, 2014, *Federal Register* Notice, because the the proposed rule, as it applies to conventional uranium mill tailings impoundments, is based, in a significant part, on the incorrect and unsubstantiated claim that the Shootaring Canyon tailings impoundment has a synthetic liner. Therefore, the proposed rule lacks a significant factual basis.

Sincerely,

Sarah Fields

Tony,

I am leaning toward the 9/3-9/4 dates, but I have a few questions. Could you please explain what the contractor would be doing for us at the public hearing? Do we think these activities could be covered by us or Regional people? Is it possible we could request a 2 month no-cost extension of the work assignment? Thanks

Reid

Tony,

I am leaning toward the 9/3-9/4 dates, but I have a few questions. Could you please explain what the contractor would be doing for us at the public hearing? Do we think these activities could be covered by us or Regional people? Is it possible we could request a 2 month no-cost extension of the work assignment? Thanks

Reid

All,

Staff from Senator Udall (CO) have contacted our congressional office regarding issues with the Ute Mountain Ute tribe. The tribe contacted the Senator's office to discuss the Subpart W proposed rulemaking. I believe they will be expressing their disappointment with our consultation taking place after the rule was proposed. I explained to Josh Lewis that we would be available next week to speak to the staff regarding our communications with the tribe over the last 5 years.
Thanks

Reid,
We are trying to get them finalized tomorrow (Friday) to send, but it may roll into Monday. Perhaps with that in mind we should scratch next Tuesday-Wednesday and aim for the 24-26th time frame. That will still give you a couple weeks before the consultation date to prepare.

Hi Scott,

We would like to have the conference call with you as soon as practicable. However, we would like to have your questions in hand so we can discuss them with you during the call. Can you give me a better idea of when you will be able to transmit your questions? I would like at least a day or two to get them to EPA participants so we can discuss your concerns more effectively. Thanks.

I'll be away from my desk all day, in training, but I will check my email and voice mail at the end of the day. Thanks again.

HI Reid,
We are working on preparing the questions that we will want answers for at the upcoming consultation meeting. We are planning to have those to your team at EPA in the next few days.
We would like to schedule our second pre-consultation call to clarify the questions. We have availability next Tuesday (I can skip out of a little of my ROC meeting if necessary) or Wednesday afternoon. I think we could bump it into the following week, 24-26th but I will need to confirm that with our team. Please consider some dates.
Thanks,
Scott

Subject: Comments to Docket

Hello Sarah,

I hope you are well. I wanted to let you know that I have received your emails concerning the Subpart W issues you have raised. Looking at the emails, I believe that these are comments from you specific to the Subpart W proposed rulemaking, and as such they belong in the dedicated Subpart W docket. Please submit your comments, identified by Docket ID No**. EPA-HQ-OAR-2008-0218**, to www.regulations.gov: Follow the on-line instructions for submitting comments. For additional information about EPA's public docket visit the EPA Docket Center homepage at http://www.epa.gov/epahome/dockets.htm. Thanks.

Dear Mr. Rosnick,

The National Tribal Air Association (NTAA) is an autonomous organization with 80 principal member Tribes. The organization's mission is to advance air quality management policies and programs, consistent with the needs, interests, and unique legal status of Indian Tribes. As such, the NTAA uses its resources to support the efforts of all federally recognized Tribes in protecting and improving the air quality within their respective jurisdictions.

On behalf of the NTAA, I am writing to request that EPA extend the public comment period for the proposed rule issued in the Federal Register on May 2, 2014, which would revise Subpart W of 40 CFR Part 61, "*National Emission Standards for Operating Uranium Mill Tailings*". Specifically, the *NTAA is requesting the maximum comment extension period of 120 days*.

This rule addresses both conventional uranium milling operations as well as future extraction activities, namely in-situ leach/recovery (ISL) sites. Domestic uranium milling and mining operations to date have left in their wake a disturbing legacy of environmental injustice in Indian Country. As a national organization whose mission it is to advance air quality management and policies for federally recognized Tribes, it is only prudent that NTAA thoroughly evaluate the consequences of the proposed rule, including the potential impacts on Tribal communities, and subsequently provide comments to EPA. Given the serious complexity of the proposed rule, as well as the wide ranging implications for affected Tribes, we strongly request that you grant the aforementioned extension.

For our part, NTAA was only made aware of the proposed rule within the last two weeks. The public comment extension will help to promote a just and equitable public participation process by giving the NTAA, member Tribes, and those Tribes indicated on EPA's consultation list adequate time to examine the complex science and the associated human health considerations embodied in the proposed rule.

Sincerely,

Bill Thompson
Chairman, NTAA

Twa-le, thank you for your email. I noticed that as well and was really surprised not to see Spokane Tribe on the list.

I made one minor edit to the document (attached). There were two places were the term "Tribe" was not capitalized. That's resolved now.

Best,

Cristina

Thanks Christina,

I see the Spokane Tribe isn't even on the consultation list and we have uranium and mill issues. We are passed the deadline according to the letter to request formal consultation, so we're all on board here to support/request the extension. I'll forward onto our legal to send and draft a letter as quickly as possible to request the extension as well.

Hello all,

Please find the modified public comment extension request attached. As always, edits and feedback are more than welcome. Once we have confirmation from the EC that you approve of the language in the letter, Andy will submit it to Mr. Rosnick.

I have attached the proposed rule for your reference. Also, here is some interesting information on the consultation process for the proposed rule:

See: Notification of Consultation on National Emission Standards for Hazardous Air Pollutants - Operating Uranium Mill Tailings Piles (40 CFR 61, Subpart W) - http://tcots.epa.gov/oita/tconsultation.nsf/TC?OpenView
> List of Tribes consulted and a copy of the letter that was sent to the
> Tribes

Thank you in advance for your response.

Respectfully,

Cristina

Yes, Brandy and Angela, I absolutely agree with you about the need for a stronger argument in favor of the extension.

As Andy mentioned, we will (1) draft a more compelling argument for the extension, (2) specify the duration of the request, (3) add the language describing NTAA, (4) add the submission date to the top of the page, and lastly, get the new draft out today for final review.

Thank you to everyone for your feedback.

Best,

Cristina

Andy/Cristina,

How long do you want the extension? 60 or 90 days. They will need/want that information. If you prose a problem, provide a solution.

Also put a date on the letter.

I would also put in a short section that describes NTAA as right now they don't understand that this letter represents 80+ members .

Argument is weak and may not be given a fair shake. Strengthen the argument with a few more sentences... NTAA just saw this, not well communicated in Indian Country, need time to share information on rule, provide invite to NTAA Policy call (again solution)...etc...

It will be too easy for them to push the letter aside as stated.

Subject: Draft NTAA Extension Request on EPA draft rule on radon emissions from Uranium Mills

Hello Everyone:

For those who were on last month's EPA Air Policy Update call, you might remember that someone mentioned the need to respond to a proposed EPA rule on Radon Emissions from Uranium Mills. Since the call, Cristina and I have done some research and have crafted a response that we would like to discuss on the EC call next week or secure email approve to proceed this week.

Basically, EPA recently issued a proposed rule for "Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings". The link for the rule is here: http://www.gpo.gov/fdsys/pkg/FR-2014-05-02/pdf/2014-09728.pdf

This rule may have important implications for Tribes throughout the nation, however, the short comment period leaves insufficient time for interested Tribes to submit meaningful comments. It's a complex rule that will no doubt require time to sort through prior to drafting informed, impactful comments. The current deadline is July 31, which is fast approaching. At this point, it seems like the most prudent action is to request a public comment period extension from EPA. Cristina drafted up a boiler plate request that with EC permission, we can submit as soon as possible.

In addition, we have asked an EPA contact identified in the rule to come onto the EPA Air Policy update call on June 26th to provide a briefing on the proposed rule. He has confirmed that he can present and will be included on the agenda.

Please take a look at the attached short letter and either provide your comments and feedback via email or if we don't hear any response, we will address it on the EC call coming up on June 16th.

Thanks so much!

Andy

All,

I got a phone call from Josh Lewis in Congressional yesterday. Sen Udall (CO) staff contacted his office on behalf of the Ute Mt. Ute tribe regarding concerns they have with the Subpart W proposed rule. Josh suggested a phone call with the Senator's staff to address the concerns. I sent back a voice mail saying we would be happy to oblige, and that we have had a lot of contact with the tribe. I'll keep you posted.

Subject: RE: Rescheduling the hearing: might you have rooms available on August 26-27

Reid is out until tomorrow. Could we go ahead and reserve the rooms, and cancel tomorrow if Reid isn't available those days. If that approach doesn't cause any problems for Region 8, please reserve the rooms. If it is a problem, we'll just have to wait until Reid is back.

Thanks again for all your support on these hearings!

Hello all,

Please find the modified public comment extension request attached. As always, edits and feedback are more than welcome. Once we have confirmation from the EC that you approve of the language in the letter, Andy will submit it to Mr. Rosnick.

I have attached the proposed rule for your reference. Also, here is some interesting information on the consultation process for the proposed rule:

See: Notification of Consultation on National Emission Standards for Hazardous Air Pollutants - Operating Uranium Mill Tailings Piles (40 CFR 61, Subpart W) - http://tcots.epa.gov/oita/tconsultation.nsf/TC?OpenView
> List of Tribes consulted and a copy of the letter that was sent to the
> Tribes

Thank you in advance for your response.

Respectfully,

Cristina

Yes, Brandy and Angela, I absolutely agree with you about the need for a stronger argument in favor of the extension.

As Andy mentioned, we will (1) draft a more compelling argument for the extension, (2) specify the duration of the request, (3) add the language describing NTAA, (4) add the submission date to the top of the page, and lastly, get the new draft out today for final review.

Thank you to everyone for your feedback.

Best,

Cristina

Andy/Cristina,

How long do you want the extension? 60 or 90 days. They will need/want that information. If you prose a problem, provide a solution.

Also put a date on the letter.

I would also put in a short section that describes NTAA as right now they don't understand that this letter represents 80+ members .

Argument is weak and may not be given a fair shake. Strengthen the argument with a few more sentences... NTAA just saw this, not well communicated in Indian Country, need time to share information on rule, provide invite to NTAA Policy call (again solution)...etc...

It will be too easy for them to push the letter aside as stated.

Subject: Draft NTAA Extension Request on EPA draft rule on radon emissions from Uranium Mills

Hello Everyone:

For those who were on last month's EPA Air Policy Update call, you might remember that someone mentioned the need to respond to a proposed EPA rule on Radon Emissions from Uranium Mills. Since the call, Cristina and I have done some research and have crafted a response that we would like to discuss on the EC call next week or secure email approve to proceed this week.

Basically, EPA recently issued a proposed rule for "Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings". The link for the rule is here: http://www.gpo.gov/fdsys/pkg/FR-2014-05-02/pdf/2014-09728.pdf

This rule may have important implications for Tribes throughout the nation, however, the short comment period leaves insufficient time for interested Tribes to submit meaningful comments. It's a complex rule that will no doubt require time to sort through prior to drafting informed, impactful comments. The current deadline is July 31, which is fast approaching. At this point, it seems like the most prudent action is to request a public comment period extension from EPA. Cristina drafted up a boiler plate request that with EC permission, we can submit as soon as possible.

In addition, we have asked an EPA contact identified in the rule to come onto the EPA Air Policy update call on June 26th to provide a briefing on the proposed rule. He has confirmed that he can present and will be included on the agenda.

Please take a look at the attached short letter and either provide your comments and feedback via email or if we don't hear any response, we will address it on the EC call coming up on June 16th.

Thanks so much!

Andy

FEDERAL REGISTER

Vol. 79 Friday,

No. 85 May 2, 2014

Part III

Environmental Protection Agency

40 CFR Part 61

Revisions to National Emission Standards for Radon Emissions from Operating Mill Tailings; Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 61

[EPA–HQ–OAR–2008–0218; FRL–9816–2]

RIN 2060–AP26

Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing to revise certain portions of the National Emission Standards for Hazardous Air Pollutants (NESHAP) for radon emissions from operating uranium mill tailings. The proposed revisions are based on EPA's determination as to what constitutes generally available control technology or management practices (GACT) for this area source category. We are also proposing to add new definitions to this rule, revise existing definitions and clarify that the rule applies to uranium recovery facilities that extract uranium through the in-situ leach method and the heap leach method.

DATES: Comments must be received on or before July 31, 2014.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OAR–2008–0218, by one of the following methods:

- *www.regulations.gov*: Follow the on-line instructions for submitting comments.
- *Email: a-and-r-docket@epa.gov.*
- *Fax:* 202–566–9744.
- *Mail:* Air and Radiation Docket, Environmental Protection Agency, Mailcode: 2822T, 1200 Pennsylvania Ave. NW., Washington, DC 20460.
- *Hand Delivery:* EPA West Building, Room 3334, 1301 Constitution Ave. NW., Washington, DC 20004. Such deliveries are only accepted during the Docket's normal hours of operation, and special arrangements should be made for deliveries of boxed information.

Instructions: Direct your comments to Docket ID No. EPA–HQ–OAR–2008–0218. EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *www.regulations.gov*, including any personal information provided, unless the comment includes information claimed to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through *www.regulations.gov* or email. The *www.regulations.gov* Web site is an ''anonymous access'' system, which means EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to EPA without going through *www.regulations.gov* your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment. Electronic files should avoid the use of special characters, any form of encryption, and be free of any defects or viruses. For additional information about EPA's public docket visit the EPA Docket Center homepage at *http://www.epa.gov/epahome/dockets.htm.*

Docket: All documents in the docket are listed in the *www.regulations.gov* index. Although listed in the index, some information is not publicly available, e.g., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available only in hard copy. Publicly available docket materials are available either electronically in *www.regulations.gov* or in hard copy at the Office of Air and Radiation Docket, EPA/DC, EPA West, Room 3334, 1301 Constitution Ave. NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air and Radiation Docket is (202) 566–1792.

FOR FURTHER INFORMATION CONTACT: Reid J. Rosnick, Office of Radiation and Indoor Air, Radiation Protection Division, Mailcode 6608J, U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460; telephone number: 202–343–9290; fax number: 202–343–2304; email address: *rosnick.reid@epa.gov.*

SUPPLEMENTARY INFORMATION:

Outline. The information in this preamble is organized as follows:

I. General Information

A. Does this action apply to me?

The regulated categories and entities potentially affected by the proposed standards include:

Category	NAICS code [1]	Examples of regulated entities
Industry:		
Uranium Ores Mining and/or Beneficiating	212291	Area source facilities that extract or concentrate uranium from any ore processed primarily for its source material content.
Leaching of Uranium, Radium or Vanadium Ores	212291	Area source facilities that extract or concentrate uranium from any ore processed primarily for its source material content.

[1] North American Industry Classification System.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this proposed action. If you have any questions regarding the applicability of this action to a particular entity, consult either the air permit authority for the entity or your EPA regional representative as listed in 40 CFR 61.04 of subpart A (General Provisions).

B. What should I consider as I prepare my comments for EPA?

1. *Submitting CBI.* Do not submit this information to EPA through *www.regulations.gov* or email. Clearly mark the part or all of the information that you claim to be CBI. For CBI information in a disk or CD ROM that you mail to EPA, mark the outside of the disk or CD ROM as CBI and then identify electronically within the disk or CD ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. Information marked as CBI will not be disclosed except in accordance with procedures set forth in 40 CFR part 2.

2. *Tips for Preparing Your Comments.* When submitting comments, remember to:

- Identify the rulemaking by docket number and other identifying information (subject heading, **Federal Register** date and page number).
- Follow directions—The agency may ask you to respond to specific questions or organize comments by referencing a Code of Federal Regulations (CFR) part or section number.
- Explain why you agree or disagree, suggest alternatives, and substitute language for your requested changes.
- Describe any assumptions and provide any technical information and/or data that you used.
- If you estimate potential costs or burdens, explain how you arrived at your estimate in sufficient detail to allow for it to be reproduced.
- Provide specific examples to illustrate your concerns, and suggest alternatives.
- Explain your views as clearly as possible, avoiding the use of profanity or personal threats.

Make sure to submit your comments by the comment period deadline identified.

C. Acronyms and Abbreviations

We use many acronyms and abbreviations in this document. These include:

AEA—Atomic Energy Act
ALARA—As low as reasonably achievable
BID—Background information document
CAA—Clean Air Act
CAAA—Clean Air Act Amendments of 1990
CCAT—Colorado Citizens Against Toxic Waste
CFR—Code of Federal Regulations
Ci—Curie, a unit of radioactivity equal to the amount of a radioactive isotope that decays at the rate of 3.7×10^{10} disintegrations per second.
DOE—U.S. Department of Energy
EIA—economic impact analysis
EO—Executive Order
EPA—U.S. Environmental Protection Agency
FR—Federal Register
GACT—Generally Available Control Technology
gpm—Gallons Per Minute
HAP—Hazardous Air Pollutant
ICRP—International Commission on Radiological Protection
ISL—In-situ leach uranium recovery, also known as in-situ recovery (ISR)
LCF—Latent Cancer Fatality—Death resulting from cancer that became active after a latent period following exposure to radiation
NAAQS—National Ambient Air Quality Standards
NCRP—National Council on Radiation Protection and Measurements
mrem—millirem, 1×10^{-3} rem
MACT—Maximum Achievable Control Technology
NESHAP—National Emission Standard for Hazardous Air Pollutants
NRC—U.S. Nuclear Regulatory Commission
OMB—Office of Management and Budget
pCi—picocurie, 1×10^{-12} curie
Ra-226—Radium-226
Rn-222—Radon-222
Radon flux—A term applied to the amount of radon crossing a unit area per unit time, as in picocuries per square centimeter per second (pCi/m^2/sec).
RCRA—Resource Conservation and Recovery Act
Subpart W—National Emission Standards for Radon Emissions from Operating Mill Tailings at 40 CFR 61.250–61.256
TEDE—Total Effective Dose Equivalent
UMTRCA—Uranium Mill Tailings Radiation Control Act of 1978
U.S.C.—United States Code

D. Where can I get a copy of this document?

In addition to being available in the docket, an electronic copy of this proposed action will also be available on the Worldwide Web (WWW) through the Technology Transfer Network (TTN). Following signature, a copy of this proposed action will be posted on the TTN's policy and guidance page for newly proposed or promulgated rules at the following address: *http://www.epa.gov/ttn/oarpg/.* The TTN provides information and technology exchange in various areas of air pollution control.

E. When would a public hearing occur?

If anyone contacts EPA requesting to speak at a public hearing concerning this proposed rule by July 1, 2014, we will hold a public hearing. If you are interested in attending the public hearing, contact Mr. Anthony Nesky at (202) 343–9597 to verify that a hearing will be held and if you wish to speak. If a public hearing is held, we will announce the date, time and venue on our Web site at *http://www.epa.gov/radiation.*

II. Background Information for Proposed Area Source Standards

A. What is the statutory authority for the proposed standards?

Section 112(q)(1) of the Clean Air Act (CAA) requires that National Emission Standards for Hazardous Air Pollutants (NESHAP) ''in effect before the date of enactment of the Clean Air Act Amendments of 1990 [Nov. 15, 1990] . . . shall be reviewed and, if appropriate, revised, to comply with the requirements of subsection (d) of . . . section [112].'' EPA promulgated 40 CFR part 61, Subpart W, ''National Emission Standards for Radon Emissions From Operating Mill Tailings,'' (''Subpart W'') on December 15, 1989.[1] EPA is conducting this review of Subpart W under CAA section 112(q)(1) to determine what revisions, if any, are appropriate.

Section 112(d) of the CAA requires EPA to establish emission standards for major and area source categories that are listed for regulation under CAA section 112(c). A major source is any stationary source that emits or has the potential to emit 10 tons per year (tpy) or more of any single hazardous air pollutant (HAP) or 25 tpy or more of any combination of HAP. An area source is a stationary source of HAP that is not a major source. For the purposes of Subpart W, the HAP at issue is radon-222 (hereafter referred to as ''radon''). We presently have no data or information that shows any other HAPs being emitted from these impoundments. Calculations of radon emissions from operating uranium recovery facilities have shown that facilities regulated under Subpart W are area sources (EPA–HQ–OAR–2008–0218–0001, 0002).

Section 112(q)(1) does not dictate how EPA must conduct its review of those NESHAPs issued prior to 1990. Rather, it provides that the Agency must review, and if appropriate, revise the standards to comply with the requirements of section 112(d). Determining what revisions, if any, are appropriate for these NESHAPs is best assessed through a case-by-case consideration of each NESHAP. As explained below, in this case, we have reviewed Subpart W and are revising the standards consistent with section 112(d)(5), which provides EPA authority to issue standards for area sources.

Under CAA section 112(d)(5), the Administrator may elect to promulgate standards or requirements for area sources ''which provide for the use of generally available control technologies or management practices by such sources to reduce emissions of hazardous air pollutants.'' Under section 112(d)(5), the Administrator has the discretion to use generally available control technology or management practices (GACT) in lieu of maximum achievable control technology (MACT) under section 112(d)(2) and (d)(3), which is required for major sources. Pursuant to section 112(d)(5), we are proposing revisions to Subpart W to reflect GACT.

B. What criteria did EPA use in developing the proposed GACT standards for these area sources?

Additional information on generally available control technologies or management practices (GACT) is found in the Senate report on the legislation (Senate Report Number 101–228, December 20, 1989), which describes GACT as:

> * * * methods, practices and techniques which are commercially available and appropriate for application by the sources in the category considering economic impacts and the technical capabilities of the firms to operate and maintain the emissions control systems.

Consistent with the legislative history, we can consider costs and economic impacts in determining GACT, which is particularly important when developing regulations for source categories, like this one, that may include small businesses.

Determining what constitutes GACT involves considering the control technologies and management practices that are generally available to the area sources in the source category. We also consider the standards applicable to major sources[2] in the same industrial sector to determine if the control technologies and management practices are transferable and generally available to area sources. In appropriate circumstances, we may also consider technologies and practices at area and major sources in similar categories to determine whether such technologies and practices could be considered generally available for the area source category at issue. Finally, as noted above, in determining GACT for a particular area source category, we consider the costs and economic impacts of available control technologies and management practices on that category.

C. What source category is affected by the proposed standards?

As defined by EPA pursuant to the CAA, the source category for Subpart W is ''facilities licensed [by the U.S. Nuclear Regulatory Commission (NRC)] to manage uranium byproduct material during and following the processing of uranium ores, commonly referred to as uranium mills and their associated tailings.'' 40 CFR 61.250. Subpart W defines ''uranium byproduct material or tailings'' as ''the waste produced by the extraction or concentration of uranium from any ore processed primarily for its source material content.''[3] 40 CFR 61.251(g). For clarity, in this proposed rule we refer to this source category by the term ''uranium recovery facilities'' and we are proposing to add this phrase to the definitions section of the rule. Use of this term encompasses the existing universe of facilities whose HAP emissions are currently regulated under Subpart W. Uranium recovery facilities process uranium ore to extract uranium. The HAP emissions from any type of uranium recovery facility that manages uranium byproduct material or tailings is subject to regulation under Subpart W. This currently includes three types of uranium recovery facilities: (1) Conventional uranium mills; (2) in-situ leach recovery facilities; and (3) heap leach facilities. Subpart W requirements specifically apply to the affected sources at the uranium recovery facilities that are used to manage or contain the uranium byproduct material or tailings. Common names for these structures may include, but are not limited to, impoundments, tailings impoundments, evaporation or holding ponds, and heap leach piles. However, the name itself is not important for determining whether Subpart W requirements apply to that structure; rather, applicability is based

[1] On April 26, 2007, Colorado Citizens Against Toxic Waste and Rocky Mountain Clean Air Action filed a lawsuit against EPA (EPA–HQ–OAR–2008–0218–0013) for EPA's alleged failure to review and, if appropriate, revise NESHAP Subpart W under CAA section 112(q)(1). A settlement agreement was entered into between the parties in November 2009(EPA–HQ–OAR–2008–0218–0019).

[2] None of the sources in this source category are major sources.

[3] Pursuant to the Atomic Energy Act of 1954, as amended, the Nuclear Regulatory Commission defines ''source material'' as ''(1) Uranium or thorium or any combination of uranium or thorium in any chemical or physical form; or (2) Ores that contain, by weight, one-twentieth of one percent (0.05 percent), or more, of uranium or thorium, or any combination of uranium or thorium.'' (10 CFR 20.1003) For a uranium recovery facility licensed by the Nuclear Regulatory Commission under 10 CFR Part 40, ''byproduct material'' means the ''tailings or wastes produced by the extraction or concentration of uranium or thorium from ore processed primarily for its source material content, including discrete surface wastes resulting from uranium solution extraction processes.'' (10 CFR 20.1003 and 40.4)

on the use of these structures to manage or contain uranium byproduct material.

D. What are the production operations, emission sources, and available controls?

As noted above, uranium recovery and processing currently occurs by one of three methods: (1) Conventional milling; (2) in-situ leach (ISL); and (3) heap leach. Below we present a brief explanation of the various uranium recovery methods and the usual structures that contain uranium byproduct materials.

(1) Conventional Mills

Conventional milling is one of the two primary recovery methods that are currently used to extract uranium from uranium-bearing ore. Conventional mills are typically located in areas of low population density. Only one conventional mill in the United States is currently operating; all others are in standby, in decommissioning (closure) or have been decommissioned.

A conventional uranium mill is a chemical plant that extracts uranium using the following process:

(A) Trucks deliver uranium ore to the mill, where it is crushed before the uranium is extracted through a leaching process. In most cases, sulfuric acid is the leaching agent, but alkaline solutions can also be used to leach the uranium from the ore. The process generally extracts 90 to 95 percent of the uranium from the ore.

(B) The mill then concentrates the extracted uranium to produce a uranium oxide material which is called ''yellowcake'' because of its yellowish color.[4]

(C) Finally, the yellowcake is transported to a uranium conversion facility where it is processed through the stages of the nuclear fuel cycle to produce fuel for use in nuclear power reactors.

(D) The extraction process in (A) and (B) above produces both solid and liquid wastes (i.e., uranium byproduct material, or ''tailings'') which are transported from the extraction location to an on-site tailings impoundment or a pond for temporary storage.

Uranium byproduct material/tailings are typically created in slurry form during the crushing, leaching and concentration processes and are then deposited in an impoundment or ''mill tailings pile'' which must be carefully monitored and controlled. This is because the mill tailings contain heavy metal ore constituents, including radium. The radium decays to produce radon, which may then be released to the environment. Because radon is a radioactive gas which may be inhaled into the respiratory tract, EPA has determined that exposure to radon and its daughter products contributes to an increased risk of lung cancer.[5]

The holding or evaporation ponds at this type of facility hold liquids containing byproduct material from which HAP emissions are also regulated under Subpart W. These ponds are discussed in more detail in the next section.

(2) In-Situ Leach/Recovery

In-situ leach or recovery sites (ISL/ISR, in this document we will use ISL) represent the majority of the uranium recovery operations that currently exist. The research and development projects and associated pilot projects of the 1980s demonstrated ISL as a viable uranium recovery technique where site conditions (e.g., geology) are amenable to its use. Economically, this technology produces a better return on the investment dollar (EPA–HQ–OAR–2008–0218–0087); therefore, the cost to produce uranium is more favorable to investors. Due to this, the trend in uranium production has been toward the ISL process.

In-situ leaching is defined as the underground leaching or recovery of uranium from the host rock (typically sandstone) by chemicals, followed by recovery of uranium at the surface. Leaching, or more correctly the re-mobilization of uranium into solution, is accomplished through the underground injection of a lixiviant (described below) into the host rock (i.e., ore body) through wells that are connected to the ore formation. A lixiviant is a chemical solution used to extract (or leach) uranium from underground ore bodies.

The injection of a lixiviant essentially reverses the geochemical reactions that resulted in the formation of the uranium deposit. The lixiviant assures that the dissolved uranium, as well as other metals, remains in the solution while it is collected from the ore zone by recovery wells, which pump the solution to the surface. At the surface, the uranium is recovered in an ion-exchange column and further processed into yellowcake. The yellowcake is packaged and transported to a uranium conversion facility where it is processed through the stages of the nuclear fuel cycle to produce fuel for use in nuclear power reactors.

Two types of lixiviant solutions can be used, loosely defined as ''acid'' or ''alkaline'' systems. In the U.S., the geology and geochemistry of the majority of the uranium ore bodies favors the use of alkaline lixiviants such as bicarbonate-carbonate lixiviant and oxygen. Other factors in the choice of the lixiviant are the uranium recovery efficiencies, operating costs, and the ability to achieve satisfactory ground-water restoration.

After processing, lixiviant is recharged (more carbonate/bicarbonate or dissolved carbon dioxide is added to the solution) and pumped back down into the formation for reuse in extracting more uranium. However, a small amount of this liquid is held back from reinjection to maintain a proper hydraulic gradient[6] within the wellfield. The amount of liquid held back is a function of the characteristics of the formation properties (e.g., permeability, hydraulic conductivity, transmissivity). This excess liquid is sent to an impoundment (often called an evaporation pond or holding pond) on site or injected into a deep well for disposal. These impoundments, since they contain uranium byproduct material, are subject to the requirements of Subpart W.[7] With respect to the lixiviant reinjected into the wellfield, there is a possibility of the lixiviant spreading beyond the zone of the uranium deposit (excursion), and this produces a threat of ground-water contamination. The operator of the ISL facility remediates any excursion by pumping large amounts of water in or out of the formation (at various wells) to contain the excursion, and this water (often containing byproduct material either before or after injection into or withdrawal from the formation) is often stored in the evaporation or holding ponds.[8] Although the excursion control operation itself is not regulated under Subpart W, the ponds that contain byproduct material are regulated under that subpart, since they are a potential source of radon emissions. After the ore body has been depleted, restoration of the formation (attempting to return the formation back to its original geochemical and geophysical

[4] The term ''yellowcake'' is still commonly used to refer to this material, although in addition to yellow the uranium oxide material can also be black or grey in color.

[5] *http://www.epa.gov/radon/risk_assessment.html*.

[6] The hydraulic gradient determines which direction water in the formation will flow, which in this case limits the amount of water that migrates away from the ore zone.

[7] As described later in this preamble, the design requirements for these impoundments are derived from the RCRA requirements for impoundments.

[8] By controlling the hydraulic gradient of the formation the operator controls the direction of flow of water, containing the water within specified limits of the formation.

properties) is accomplished by flushing the host rock with water and sometimes additional chemicals. Since small amounts of uranium are still contained in the returning water, the restoration fluids are also considered byproduct material, and are usually sent to evaporation ponds for disposition.

(3) Heap Leaching

In addition to conventional uranium milling and ISL, some facilities may use an extraction method known as heap leaching. In some instances uranium ore is of such low grade, or the geology of the ore body is such that it is not cost-effective to remove the uranium via conventional milling or through ISL.[9] In this case a heap leaching method may be utilized.

No such facilities currently operate to recover uranium in the U.S. However, there are plans for at least one facility to open in the U.S. within the next few years.

Heap leach operations involve the following process:

A. Small pieces of ore are placed in a large pile, or ''heap,'' on an impervious geosynthetic liner with perforated pipes under the heap. For the purposes of Subpart W the impervious pad will meet the requirements for design and construction of impoundments found at 40 CFR 192.32(a).

B. An acidic solution is then sprayed[10] over the ore to dissolve the uranium it contains.

C. The uranium-rich solution drains into the perforated pipes, where it is collected and transferred to an ion-exchange system.

D. The heap is ''rested,'' meaning that there is a temporary cessation of application of acidic solution to allow for oxidation of the ore before leaching begins again.

E. The ion-exchange system extracts the uranium from solution where it is later processed into a yellowcake.[11]

F. Once the uranium has been extracted, the remaining solution still contains small amounts of uranium byproduct material (the extraction process is not 100% effective), and this solution is either piped to the heap leach pile to be reused or piped to an evaporation or holding pond. In the evaporation pond it is subject to the Subpart W requirements.

G. The yellowcake is transported to a uranium conversion facility where it is processed through the stages of the nuclear fuel cycle to produce fuel for use in nuclear power reactors.

H. Finally, there is a final drain down of the heap solutions, as well as a possible rinsing of the heap. These solutions will contain byproduct material and will be piped to evaporation or holding ponds, where they become subject to the Subpart W requirements. The heap leach pile will be closed in place according to the requirements of 40 CFR 192.32.

Today we are proposing to regulate the HAP emissions from heap leach uranium extraction under Subpart W, in addition to conventional impoundments and evaporation ponds, which are already regulated under this Subpart. Our rationale (explained in greater detail in Section IV.D.4.) is that from the moment uranium extraction takes place in the heap, uranium byproduct material is left behind. Therefore the byproduct material must be managed with the same design as a conventional impoundment, with a liner and leak detection system prescribed at 40 CFR 192.32(a), and an effective method of limiting radon emissions while the heap leach pile is being used to extract uranium.

As described above, there may also be holding or evaporation ponds at this type of facility. In many cases these ponds hold liquids containing byproduct material. The byproduct material is contained in the liquids used to leach uranium from the ore in the heap leach pile as well as draining the heap leach pile in preparation for closure. The HAP emissions from these fluids are currently regulated under Subpart W.

E. What are the existing requirements under Subpart W?

Subpart W was promulgated on December 15, 1989 (54 FR 51654). At the time of promulgation the predominant form of uranium recovery was through the use of conventional mills. There are two separate standards required in Subpart W. The first standard is for ''existing'' impoundments, e.g., those in existence and licensed by the NRC (or it's Agreement States) on or prior to December 15, 1989. Owners or operators of existing tailings impoundments must ensure that emissions from those impoundments do not exceed a radon (Rn-222) flux standard of 20 picocuries per meter squared per second ($pCi/m^2/sec$). As stated at the time of promulgation: ''This rule will have the practical effect of requiring the mill owners to keep their piles wet or covered.''[12] Keeping the piles (impoundments) wet or covered with soil would reduce radon emissions to a level that would meet the standard. This is still considered an effective method to reduce radon emissions at all uranium tailings impoundments.

The method for monitoring for compliance with the radon flux standard was prescribed as Method 115, found at 40 CFR part 61, Appendix B. The owners or operators of existing impoundments must report to EPA the results of the compliance testing for any calendar year by no later than March 31 of the following year.

There is currently one existing operating mill with impoundments that pre-date December 15, 1989, and two mills that are currently in standby mode.

The second standard applies to ''new'' impoundments designed and/or constructed after December 15, 1989. The requirements applicable to new impoundments are work practice standards that regulate either the size and number of impoundments, or the amount of tailings that may remain uncovered at any time. 40 CFR 61.252(b) states that no new tailings impoundment can be built after December 15, 1989, unless it is designed, constructed and operated to meet one of the following two work practices:

1. Phased disposal in lined impoundments that are no more than 40 acres in area, and meet the requirements of 40 CFR 192.32(a) as determined by the NRC. The owner or operator shall have no more than two impoundments, including existing impoundments, in operation at any one time.

2. Continuous disposal of tailings that are dewatered and immediately disposed with no more than 10 acres uncovered at any time, and operated in accordance with 40 CFR 192.32(a) as determined by the NRC.

The basis of the work practice standards is to (1) limit the size of the impoundment, which limits the radon source; or (2) utilize the continuous disposal system, which prohibits large accumulations of uncovered tailings, limiting the amount of radon released.

The work practice standards described above were promulgated after EPA considered a number of factors that influence the emissions of Rn-222 from tailings impoundments, including the climate and the size of the impoundment. For example, for a given concentration of Ra-226 in the tailings, and a given grain size of the tailings, the moisture content of the tailings will control the radon emission rate; the higher the moisture content the lower the emission rate. In the arid and semi-arid areas of the country where most impoundments are located or proposed, the annual evaporation rate is quite high. As a result, the exposed tailings

[9] The ore grade is so low that it is not practical to invest large sums of capital to extract the uranium. Heap leach is a much more passive and relatively inexpensive system.

[10] Other technology includes drip systems, sometimes used at gold extraction heaps, and flooding of the heap leach pile.

[11] It is our understanding that either ion-exchange or solvent extraction techniques can be used to recover uranium at heap leach facilities. The decision to use one type or the other depends largely on the quality of the ore at a particular site.

[12] See 54 FR 51689.

(absent controls like sprinkling) dry rapidly. In previous assessments, we explicitly took the fact of rapid drying into account by using a Rn-222 flux rate of 1 pCi/m^2/s per pCi/g Ra-226 to estimate the Rn-222 source term from the dry areas of the impoundments. (**Note:** The estimated source terms from the ponded (areas completely covered by liquid) and saturated areas of the impoundments are considered to be zero, reflecting the complete attenuation of the Rn-222).

Another factor we considered was the area of the impoundment, which has a direct linear relationship with the Rn-222 source term, more so than the depth or volume of the impoundment. Again, assuming the same Ra-226 concentration and grain sizes in the tailings, a 100-acre dry impoundment will emit 10 times the radon of a 10-acre dry impoundment. This linear relationship between size and Rn-222 source term is one of the main reasons that Subpart W imposed size restrictions on all future impoundments (40 acres per impoundment if phased disposal is chosen and 10 acres total uncovered if continuous disposal is chosen).

Subpart W also mandates that all tailings impoundments at uranium recovery facilities comply with the requirements at 40 CFR 192.32(a). EPA explained the reason for adding this requirement in the preamble as follows:

> ''EPA recognizes that in the case of a tailings pile which is not synthetically or clay lined (the clay lining can be the result of natural conditions at the site) water placed on the tailings in an amount necessary to reduce radon levels, can result in ground water contamination. In addition, in certain situations the water can run off and contaminate surface water. EPA cannot allow a situation where the reduction of radon emissions comes at the expense of increased pollution of the ground or surface water. Therefore, all piles will be required to meet the requirements of 40 CFR 192.32(a) which protects water supplies from contamination. Under the current rules, existing piles are exempt from these provisions, this rule will end that exemption.''

54 FR 51654, 51680 (December 15, 1989). Therefore, all impoundments are required to meet the requirements at 40 CFR 192.32(a).

Section 192.32(a) includes a cross-reference to the surface impoundment design and construction requirements of hazardous waste surface impoundments regulated under the Resource Conservation and Recovery Act (RCRA), found at 40 CFR 264.221. Those requirements state that the impoundment shall be designed, constructed and installed to prevent any migration of wastes out of the impoundment to the adjacent subsurface soil or ground water or surface water at any time during the active life of the impoundment. Briefly, 40 CFR 264.221(c) requires that the liner system must include:

1. A top liner designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into the liner during the active life of the unit.
2. A composite bottom liner consisting of at least two components. The upper component must be designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into this component during the active life of the unit. The lower component must be designed and constructed of materials to minimize the migration of hazardous constituents if a breach in the upper component were to occur. The lower component must be constructed of at least three feet of compacted soil material with a hydraulic conductivity of no more than 1×10^{7} cm/sec.
3. A leachate collection and removal system between the liners, which acts as a leak detection system. This system must be capable of detecting, collecting and removing hazardous constituents at the earliest practicable time through all areas of the top liner likely to be exposed to the waste or liquids in the impoundment.

There are other requirements for the design and operation of the impoundment, and these include construction specifications, slope requirements, sump and liquid removal requirements.[13]

F. How did we gather information for this proposed rule?

This section describes the information we used as the basis for making the determination to revise Subpart W. We collected this information using various methods. We performed literature searches, where appropriate, of the engineering methods used by existing uranium recovery facilities in the United States as well as the rest of the world. We used this information to determine whether the technology used to contain uranium byproduct material had advanced since the time of the original promulgation of Subpart W. We reviewed and compiled a list of existing and proposed uranium recovery facilities and the containment technologies being used, as well as those proposed to be used. We compared and contrasted those technologies with the engineering requirements of hazardous waste surface impoundments regulated under Subtitle C of the Resource Conservation and Recovery Act (RCRA), which are used as the design basis for existing uranium byproduct material impoundments.

We collected information on existing uranium mills and in-situ leach facilities by issuing information collection requests authorized under section 114(a) of the CAA to seven uranium recovery facilities. At the time, this represented 100% of existing facilities. Since then, Cotter Corp. has closed its Cañon City facility. These requests required uranium recovery companies to provide detailed information about the uranium mill and/or in-situ leaching facility, as well as the number, sizes and types of affected sources (tailings impoundments, evaporation ponds and collection ponds) that now or in the past held uranium byproduct material. We requested information on the history of operation since 1975, ownership changes, whether the operation was in standby mode and whether plans existed for new facilities or reactivated operations were expected.[14] We also reviewed the regulatory history of Subpart W and the radon measurement methods used to determine compliance with the existing standards. Below is a synopsis of the information we collected and our analyses.

1. Pre-1989 Conventional Mill Impoundments

We have been able to identify three facilities, either operating or on standby,[15] that have been in operation since before the promulgation of Subpart W in 1989. These existing facilities must ensure that emissions from their operational, pre-1989 impoundments[16] not exceed a radon (Rn-222) flux standard of 20 pCi/m^2/sec. The method for monitoring for compliance with the radon flux standard was prescribed as Method 115, found at 40 CFR part 61, Appendix B. These facilities must also meet the requirements in 40 CFR 61.252(c), which cross-references the requirements of 40 CFR 192.32(a)

The White Mesa Conventional Mill in Blanding, Utah, has one pre-1989 impoundment (known by the company as Cell 3) that is currently in operation and near capacity but is still authorized and continues to receive tailings. The

[13] For detailed information on the design and operating requirements, refer to 40 CFR Part 264 Subpart K—Surface Impoundments.

[14] Section 114(a) letters and responses can be found at *http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html.*

[15] ''Standby'' is when a facility impoundment is licensed for the continued placement of tailings/byproduct material but is currently not receiving tailings/byproduct material. See Section V.A. for a discussion of this definition that we are proposing to add to Subpart W.

[16] In this preamble when we use the generic term ''impoundment,'' we are using the term as described by industry.

company is now pumping any residual free solution out of the cell and contouring the sands. It will then be determined whether any more solids need to be added to the cell to fill it to the specified final elevation. It is expected to close in the near future (EPA–HQ–OAR–2008–0218–0069). The mill also uses an impoundment constructed before 1989 as an evaporation pond (known as Cell 1). To the extent this evaporation pond contains byproduct material, its HAP emissions are also regulated by Subpart W.

The Sweetwater conventional mill is located 42 miles northwest of Rawlins, Wyoming. The mill operated for a short time in the 1980s and is currently in standby status. Annual radon values collected by the facility indicate that there is little measurable radon flux from the mill tailings that are currently in the lined impoundment. This monitoring program remains active at the facility. According to company records, of the 37 acres of tailings, approximately 28.3 acres of tailings are covered with soil; the remainder of the tailings are continuously covered with water. The dry tailings have an earthen cover that is maintained as needed. During each monitoring event one hundred radon flux measurements are taken on the tailings continuously covered by soil, as required by Method 115 for compliance with Subpart W. The mean radon flux for the exposed tailings over the past 21 years was 3.5 pCi/m^2/sec. The radon flux for the entire tailings impoundment was calculated to be 6.01 pCi/m^2/sec. The calculated radon flux from the entire tailings impoundment surface is thus approximately 30% of the 20.0 pCi/m^2/sec standard (EPA–HQ–OAR–2008–0218–0087).

The Shootaring Canyon project is a conventional mill located about 3 miles north of Ticaboo, Utah, in Garfield County. The approximately 1,900-acre site includes an ore pad, a small milling building, and a tailings impoundment system that is partially constructed. The mill operated for a very short period of time. Shootaring Canyon did pre-date the standard, but the mill was shut down prior to the promulgation of the standard. The impoundment is in a standby status and has an active license administered by the Utah Department of Environmental Quality, Division of Radiation Control. The future plans for this uranium recovery operation are unknown. Current activities at this remote site consist of intermittent environmental monitoring by consultants to the parent company (EPA–HQ–OAR–2008–0218–0087).

The Shootaring Canyon mill operated for approximately 30 days. Tailings were deposited in a portion of the upper impoundment. A lower impoundment was conceptually designed but has not been built. Milling operations in 1982 produced 25,000 cubic yards of tailings, deposited in a 2,508 m^2 (0.62 acres) area. The tailings are dry except for moisture associated with occasional precipitation events; consequently, there are no beaches.[17] The tailings have a soil cover that is maintained by the operating company. Radon sampling for the 2010 year took place in April. Again, one hundred radon flux measurements were collected. The average radon flux from this sampling event was 11.9 pCi/m^2-sec.

A fourth mill is Cotter Corporation in Cañon City, Colorado. The mill no longer exists, and the pre-1989 impoundments are in closure.

2. 1989–Present Conventional Mill Impoundments

There currently is only one operating conventional mill with an impoundment that was constructed after December 15, 1989. The White Mesa conventional mill in Utah has two impoundments (Cell 4A and Cell 4B: Cell 4A is currently operating as a conventional impoundment and Cell 4B is being used as an evaporation pond) designed and constructed after 1989. The facility uses the phased disposal work practice.

There are several conventional mills in the planning and/or permitting stage and conventional impoundments at these mills will be required to utilize one of the current work practice standards.

3. In-Situ Leach Facilities

After 1989 the price of uranium began to fall, and the uranium mining and milling industry essentially collapsed, with very few operations remaining in business. However, several years ago the price of uranium began to rise so that it became profitable once more for companies to consider uranium recovery. ISL has become the preferred choice for uranium extraction where suitable geologic conditions exist.

Currently there are five ISL facilities in operation: (1) The Alta Mesa project in Brooks County, Texas; (2) the Crow Butte Operation in Dawes County, Nebraska; (3) the Hobson/La Palangana Operation in South Texas; (4) the Willow Creek (formerly Christensen Ranch/Irigaray Ranch) Operation in Wyoming; and (5) the Smith Ranch-Highland Operation in Converse County, Wyoming.[18] These facilities use or have used evaporation ponds to hold back liquids containing uranium byproduct material from reinjection to maintain a proper hydraulic gradient within the wellfield.[19] These ponds are subject to the Subpart W requirements and range in size from less than an acre to up to 40 acres. Based on the information provided to us the ponds meet the requirements of 40 CFR 61.252(c).

There are approximately 11 additional ISL facilities in various stages of licensing or on standby. It is anticipated that there could be approximately another 20–30 license applications over the next 5–10 years.[20]

4. Heap Leach Facilities

As stated earlier, there are currently no operating heap leach facilities in the United States. We are aware of two or three potential future operations. The project most advanced in the application process is the Sheep Mountain facility in Wyoming. Energy Fuels has announced its intent to submit a license application to the NRC in March 2014. One or two other as yet to be determined operations may be located in Lander County, Nevada and/or a site in New Mexico.[21]

5. Flux Requirement Versus Management Practices for Conventional Impoundments in Operation Before December 15, 1989

In performing our analysis we considered the information we received from all the existing conventional impoundments. We also looked at the compliance history of the existing conventional impoundments. After this review we considered two specific questions: (1) Are any of the conventional impoundments using any novel methods to reduce radon emissions? (2) Is there now any reason to believe that any of the existing conventional impoundments could not comply with the management practices for new conventional impoundments, in which case would we need to continue to make the distinction between conventional impoundments constructed before or after December 15, 1989? We arrived at the following

[17] The term ''beaches'' refers to portions of the tailings impoundment where the tailings are wet but not saturated or covered with liquids.

[18] Source: U.S. Energy Information Administration, *http://www.eia.gov/uranium/production/quarterly/html/qupd_tbl4.html.*

[19] The Alta Mesa operation uses deep well injection rather than evaporation ponds.

[20] Source: *http://www.nrc.gov/materials/uranium-recovery/license-apps/ur-projects-list-public.pdf.*

[21] *http://www.nrc.gov/materials/uranium-recovery/license-apps/ur-projects-list-public.pdf.*

conclusions: First, we are not aware of any conventional impoundment that uses any new or different technologies to reduce radon emissions. Conventional impoundment operators continue to use the standard method of reducing radon emissions by limiting the size of the impoundment and covering tailings with soil or keeping tailings wet. These are very effective methods for limiting the amount of radon released to the environment.

Second, we believe that only one existing operating conventional impoundment designed and in operation before December 15, 1989, could not meet the work practice standards. This impoundment is Cell 3 at the White Mesa mill, which is expected to close in 2014 (Personal communication between EPA staff and Utah Department of Environmental Quality staff, May 16, 2013, EPA–HQ–2008–0218–0081). We were very clear in our 1989 rulemaking that all conventional mill impoundments must meet the requirements of 40 CFR 192.32(a), which, in addition to requiring ground-water monitoring, also required the use of liner systems to ensure there would be no leakage from the impoundment into the ground water. We did this by removing the exemption for existing piles from the 40 CFR 192.32(a) requirements (54 FR 51680). However, we did not require those existing impoundments to meet either the phased disposal or continuous disposal work practice standards, which limit the exposed area and/or number of conventional impoundments, thereby limiting the potential for radon emissions. This is because at the time of promulgation of the rule, conventional impoundments existed that were larger in area than the maximum work practice standard of 40 acres used for the phased disposal work practice, or 10 acres for the continuous disposal requirement. This area limitation was important in reducing the amount of exposed tailings that were available to emit radon. However, we recognized that by instituting a radon flux standard we would require owners and operators to limit radon emissions from these preexisting impoundments (usually by placing water or soil on exposed portions of the impoundments). The presumption was that conventional impoundments constructed before this date could otherwise be left in a dry and uncovered state, which would allow for unfettered release of radon. The flux standard was promulgated to have the practical effect of requiring owners and operators of these old impoundments to keep their tailings either wet or covered with soil, thereby reducing the amount of radon that could be emitted (54 FR 51680).

We believe that the existing conventional impoundments at both the Shootaring Canyon and Sweetwater facilities can meet the work practice standards in the current Subpart W regulation. The conventional impoundments at both these facilities are less than 40 acres in area and are synthetically lined as per the requirements in 40 CFR 192.32(a). We also have information that the new conventional impoundments operating at the White Mesa mill will utilize the phased work practice standard of limiting conventional impoundments to no more than two, each 40 acres or less in area. We also have information that Cell 3 at the White Mesa facility will be closed in 2014, and the phased disposal work method will be used for the remaining cells. (Personal communication between EPA staff and staff of Utah Department of Environmental Quality, May 16, 2013 (EPA–HQ–2008–0218–0081). As a result, we find there would be no conventional impoundment designed or constructed before December 15, 1989 that could not meet a work practice standard. Since the conventional impoundments in existence prior to December 15, 1989 appear to meet the work practice standards, we are proposing to eliminate the distinction of whether the conventional impoundment was constructed before or after December 15, 1989. We are also proposing that all conventional impoundments (including those in existence prior to December 15, 1989) must meet the requirements of one of the two work practice standards, and that the flux standard of 20 pCi/m^2/sec will no longer be required for the impoundments in existence prior to December 15, 1989.

G. How does this action relate to other EPA standards?

Under the CAA, EPA promulgated Subpart W, which includes standards and other requirements for controlling radon emissions from operating mill tailings at uranium recovery facilities. Under our authority in the Uranium Mill Tailings Radiation Control Act of 1978 (UMTRCA), we have also issued standards that are more broadly applicable to uranium and thorium byproduct materials at active and inactive uranium recovery facilities. NRC (or Agreement States [22]) and DOE implement and enforce these standards at these uranium recovery facilities as directed by UMTRCA. These standards, located in 40 CFR part 192, address the radiological and non-radiological hazards of uranium and thorium byproduct materials in ground water and soil, in addition to air. For the non-radiological hazards, UMTRCA directed us to promulgate standards consistent with those used by EPA to regulate non-radiological hazardous materials under RCRA. Therefore, our part 192 standards incorporate the ground-water protection requirements applied to hazardous waste management units under RCRA and specify the placement of uranium or thorium byproduct materials in impoundments constructed in accordance with RCRA requirements. Radon emissions from non-operational impoundments (i.e., those with final covers) are limited in 40 CFR part 192 to the emissions levels of 20 pCi/m^2/sec. We are currently preparing a regulatory proposal to update provisions of 40 CFR part 192, with emphasis on ground-water protection for ISL facilities. As explained in previous sections, Subpart W currently contains reference to some of the part 192 standards.

H. Why did we conduct an updated risk assessment?

While not required by or conducted as part of our GACT analysis, one of the tasks we performed for our own purposes was to update the risk analysis we performed when we promulgated Subpart W in 1989. We performed a comparison between the 1989 risk assessment and current risk assessment approaches, focusing on the adequacy and the appropriateness of the original assessments. We did this for informational purposes only and not for or as part of our GACT analysis. Instead, we prepared this updated risk assessment because we wanted to demonstrate that even using updated risk analysis procedures (i.e. using procedures updated from those used in the 1980s), the existing radon flux standard appears to be protective of the public health and the environment. We did this by using the information we collected to perform new risk assessments for existing facilities, as well as two idealized ‘‘generic’’ sites, one located in the eastern half of the United States and one located in the southwest United States. (These two model sites do not exist. They are idealized using representative features

[22] An Agreement State is a State that has entered into an agreement with the Nuclear Regulatory Commission under section 274 of the Atomic Energy Act of 1954 (42 U.S.C. 2021)and has authority to regulate byproduct materials (as defined in section 11e.(2)of the Atomic Energy Act)and the disposal of low-level radioactive waste under such agreement.

of mills in differing climate and geography). This information has been collected into one document [23] that has been placed in the docket (EPA–HQ–OAR–2008–0218–0087) for this proposed rulemaking.

As part of this work, we evaluated various computer models that could be used to calculate the doses and risks due to the operation of conventional and ISL uranium recovery facilities, and selected CAP88 V 3.0 for use in this analysis. CAP88 V 3.0 was developed in 1988 from the AIRDOS, RADRISK, and DARTAB computer programs, which had been developed for the EPA at the Oak Ridge National Laboratory (ORNL).

CAP88 V 3.0, which stands for ''Clean Air Act Assessment Package-1988 version 3.0,'' is used to demonstrate compliance with the NESHAP requirements applicable to radionuclides. CAP88 V 3.0 calculates the doses and risk to a designated receptor as well as to the surrounding population. Exposure pathways evaluated by CAP88 V 3.0 are: inhalation, air immersion, ingestion of vegetables, meat, and milk, and ground surface exposure. CAP88 V 3.0 uses a modified Gaussian plume equation to estimate the average dispersion of radionuclides released from up to six emitting sources. The sources may be either elevated stacks, such as a smokestack, or uniform area sources, such as the surface of a uranium byproduct material impoundment. Plume rise can be calculated assuming either a momentum or buoyant-driven plume.

At several sites analyzed in this evaluation only site-wide releases of radon were available to us. This assessment was limited by the level of detail provided by owners and operators of uranium recovery facilities. In instances where more specific site data were available, site-wide radon releases were used as a bounding estimate. Assessments are done for a circular grid of distances and directions for a radius of up to 80 kilometers (50 miles) around the facility. The Gaussian plume model produces results that agree with experimental data as well as any comparable model, is fairly easy to work with, and is consistent with the random nature of turbulence. A description of CAP88 V 3.0 and the computer models upon which it is based is provided in the CAP88 V 3.0 Users Manual.[24]

The uranium recovery facilities that we analyzed included three existing conventional mills (Cotter, White Mesa and Sweetwater), five operating ISL operations (the Alta Mesa project in Brooks County, Texas; the Crow Butte Operation in Dawes County, Nebraska; the Hobson/La Palangana Operation in South Texas; the Willow Creek (formerly Christensen Ranch/Irigaray Ranch) Operation in Wyoming; and the Smith Ranch-Highland Operation in Converse County, Wyoming), and two generic sites assumed for the location of conventional mills (we chose conventional mills because we believe they have the potential for greater radon emissions). One generic site was modeled in the southwest United States (Western Generic) while the other was assumed to be located in the eastern United States (Eastern Generic).[25] An Eastern generic site was selected for the second generic site to accommodate the recognition that a number of uranium recovery facilities are expected to apply for construction licenses in the future, and to determine potential risks in geographic areas of the U.S. that customarily have not hosted uranium recovery facilities. For this assessment the conventional mills we were most interested in were the White Mesa mill and the Sweetwater mill. (The Shootaring Canyon mill was not analyzed, because the impoundment is very small and is soil covered, and the Cotter facility is now in closure). These conventional mills are either in operation or standby and are subject to the flux standard of 20 pCi/m^2/sec. The risk analyses performed for these two mills showed that the maximum lifetime cancer risks from radon emissions from the White Mesa impoundments were 1.1×10^{-4} while the maximum lifetime cancer risks from radon associated with the impoundments at the Sweetwater mill were 2.4×10^{-5}. As we indicated in our original 1989 risk assessment, in protecting public health, EPA strives to provide the maximum feasible protection by limiting lifetime cancer risk from radon exposure to approximately 1 in 10,000 (i.e., 10^{-4}).[26] The analyses also estimated that the total cancer risk to the populations surrounding all ten modeled uranium sites (i.e., total cancer fatalities) is between 0.0015 and 0.0026 fatal cancers per year, or approximately 1 case every 385 to 667 years for the 4 million persons living within 80 km of the uranium recovery facilities. Similarly, the total cancer incidence for all ten modeled sites is between 0.0021 and 0.0036 cancers per year, or approximately 1 case every 278 to 476 years. The analyses are described in more detail in the background document generated for this proposal.[27] As stated above, we performed this risk assessment for informational purposes only. The risk assessment was not required or considered during our analysis for proposing GACT standards for uranium recovery facilities (e.g., conventional impoundments, non-conventional impoundments or heap leach piles).

III. Summary of the Proposed Requirements

We are proposing to revise Subpart W to include requirements we have identified that are generally available for controlling radon emissions in a cost-effective manner, and are not currently included in Subpart W. Specifically, we are proposing to require that non-conventional impoundments and heap leach piles must maintain minimum liquid levels to control their radon emissions from these affected sources.

Additionally, we are revising Subpart W to propose GACT standards for the affected sources at conventional uranium mills, ISL facilities and heap leach facilities. Given the evolution of uranium recovery facilities over the last 20 years, we believe it is appropriate to revise Subpart W to tailor the requirements of the rule to the different types of facilities in existence at this time. We are therefore proposing to revise Subpart W to add appropriate definitions, standards and other requirements that are applicable to HAP emissions at these uranium recovery facilities.

Our experience with ensuring that uranium recovery facilities are in compliance with Subpart W also leads us to propose three more changes. First, we are proposing to remove certain monitoring requirements that we believe are no longer necessary for demonstrating compliance with the proposed GACT standards. Second, we are proposing to revise certain definitions so that owners and operators clearly understand when Subpart W applies to their facility. Third, we are proposing to clarify what specific liner

[23] Technical and Regulatory Support to Develop a Rulemaking to Potentially Modify the NESHAP Subpart W Standard for Radon Emissions from Operating Uranium Mills (40 CFR 61.250).

[24] *http://www.epa.gov/radiation/assessment/CAP88 V 3.0/index.html.*

[25] There is a potential in the future for uranium recovery in areas like south-central Virginia.

[26] See 54 FR 51656

[27] All risks are presented as LCF risks. If it is desired to estimate the morbidity risk, simply multiply the LCF risk by 1.39. For a more detailed analysis of cancer mortality and morbidity, please see the Background Information Document, Docket number EPA–HQ–OAR–0218–0087.

requirements must be met under Subpart W.[28]

Taken altogether, the proposed revisions to Subpart W are appropriate for updating, clarifying and strengthening the management of radon emissions from the uranium byproduct material generated at uranium recovery facilities.

A. What are the affected sources?

Today we are proposing to revise Subpart W to include requirements for affected sources at three types of operating uranium recovery facilities: (1) Conventional uranium mills; (2) ISL facilities; and (3) heap leach facilities. The affected sources at these uranium recovery facilities include conventional impoundments, non-conventional impoundments where tailings are contained in ponds and covered by liquids (examples of these affected sources are evaporation or holding ponds that may exist at conventional mills, ISL facilities and heap leach facilities), and heap leach piles. The proposed GACT standards and the rationale for these proposed standards are discussed below and in Section IV. We request comment on all aspects of these proposed requirements.

B. What are the proposed requirements?

1. Conventional Impoundments

In the 1989 promulgation of Subpart W we created two work practice standards, phased disposal and continuous disposal, for uranium tailings impoundments designed and constructed after December 15, 1989. The work practice standards, which limit the exposed area and/or number of conventional impoundments at a uranium recovery facility, require that these impoundments be no larger than 40 acres (for phased disposal) or 10 uncovered acres (for continuous disposal). We also limited the number of conventional impoundments operating at any one time to two. We took this approach because we recognized that the radon emissions from very large conventional impoundments could impose unacceptable health effects if the piles were left dry and uncovered. The 1989 promulgation also included the requirements in 40 CFR 192.32(a), which include design and construction requirements for the impoundments as well as requirements for prevention and mitigation of ground-water contamination.

As discussed earlier, we no longer believe that a distinction needs to be made for conventional impoundments based on the date when they were designed and/or constructed. We believe that the existing conventional impoundments at both the Shootaring Canyon and Sweetwater facilities can meet the work practice standards in the current Subpart W regulation. The conventional impoundments at both these facilities are less than 40 acres in area and are synthetically lined as per the requirements in 40 CFR 192.32(a)(1). The existing cell 3 at the White Mesa mill will undergo closure in 2014 and will be replaced with the impoundments currently under construction that meet the phased disposal work practice standard. Therefore, there is no reason not to subject these older impoundments to the work practice standards required for impoundments designed or constructed after December 15, 1989. By incorporating these impoundments under the work practices provision of Subpart W, it is no longer necessary to require radon flux monitoring, and we are proposing to eliminate that requirement.

The proposed elimination of the monitoring requirement in 40 CFR 61.253 applies only to those facilities currently subject to the radon flux standard in 40 CFR 61.252(a), which applies to only the three conventional impoundments in existence prior to the original promulgation of Subpart W on December 15, 1989. While we are proposing to eliminate the radon monitoring requirement for these three impoundments under Subpart W, this action does not relieve the owner or operator of the uranium recovery facility of the monitoring and maintenance requirements of their operating license issued by the NRC or its Agreement States. These requirements are found at 10 CFR Part 40, Appendix A, Criterion 8 and 8A. Additionally, NRC, through its Regulatory Guide 4.14, may also recommend incorporation of radionuclide air monitoring at operating facility boundaries.

Further, when the impoundments formally close they are subject to the radon monitoring requirements of 40 CFR 192.32(a)(3), also under the NRC licensing requirements.

From a cost standpoint, by not requiring radon monitoring we expect that for all three sites the total annual average cost savings would be $29,200, with a range from about $21,000 to $37,000. More details on economic costs can be found in Section IV.B of this preamble.

For the proposed rule we also evaluated the requirements of 40 CFR 192.32(a) as they pertain to the Subpart W standards. The requirements of 40 CFR 192.32(a) are included in the NRC's regulations and are reviewed for compliance by NRC during the licensing process for a uranium recovery facility. We determined that the requirements at 40 CFR 192.32(a)(1), which reference the RCRA requirements for design and operation of surface impoundments at 40 CFR 264.221, are the only requirements necessary for EPA to incorporate for Subpart W, as they are effective methods of containing tailings and protecting ground water while also limiting radon emissions. This liner requirement, described earlier in this preamble, remains in use for the permitting of hazardous waste land disposal units under RCRA. The requirements at 40 CFR 192.32(a)(1) contain safeguards to allow for the placement of tailings and yet provide an early warning system in the event of a leak in the liner system. We are therefore proposing to retain the two work practice standards and the requirements of 40 CFR 192.32(a)(1) as GACT for conventional impoundments because these methods for limiting radon emissions while also protecting ground water have proven effective for these types of impoundments.

2. Non-Conventional Impoundments Where Tailings Are Contained in Ponds and Covered by Liquids

Today we are proposing a GACT standard specifically for non-conventional impoundments where uranium byproduct materials are contained in ponds and covered by liquids. Common names for these structures may include, but are not limited to, impoundments and evaporation or holding ponds. These affected sources may be found at any of the three types of uranium recovery facilities.

These units meet the existing applicability criteria in 40 CFR 61.250 to classify them for regulation under Subpart W. The holding or evaporation ponds located at conventional mills, ISL facilities and potentially heap leach facilities contain uranium byproduct material, either in solid form or dissolved in solution, and therefore their emissions are regulated under Subpart W. As defined at 40 CFR 61.251(g), uranium byproduct material or tailings means the waste produced by the extraction or concentration of uranium from any ore processed primarily for its source material content.

[28] Under its CAA authority, EPA requires facilities subject to Subpart W to build impoundments in a manner that complies with the requirements found in 40 CFR 192. As a matter of convenience, EPA cross-references the part 192 requirements in Subpart W instead of copying them directly into Subpart W. This cross-referencing convention is often used in rulemakings.

Therefore, emissions for the ponds at uranium recovery facilities that contain either uranium byproduct material in solid form or radionuclides dissolved in liquids are regulated under Subpart W. Today we are again stating that determination and proposing a GACT standard specifically for these impoundments.

Evaporation or holding ponds, while sometimes smaller in area than conventional impoundments, perform a basic task. They hold uranium byproduct material until it can be disposed. Our survey of existing ponds shows that they contain liquids, and, as such, this general practice has been sufficient to limit the amount of radon emitted from the ponds, in many cases, to almost zero. Because of the low potential for radon emissions from these impoundments, we do not believe it is necessary to monitor them for radon emissions. We have found that as long as approximately one meter of liquid is maintained in the pond, the effective radon emissions from the pond are so low that it is difficult to determine whether there is any contribution above background radon values. EPA has stated in the *Final Rule for Radon-222 Emissions from Licensed Uranium Mill Tailings: Background Information Document* (August, 1986):

''Recent technical assessments of radon emission rates from tailings indicate that radon emissions from tailings covered with less than one meter of water, or merely saturated with water, are about 2% of emissions from dry tailings. Tailings covered with more than one meter of water are estimated to have a zero emissions rate. The Agency believes this calculated difference between 0% and 2% is negligible. The Agency used an emission rate of zero for all tailings covered with water or saturated with water in estimating radon emissions.''

Therefore, we are proposing as GACT that these impoundments meet the design and construction requirements of 40 CFR 192.32(a)(1), with no size/area restriction, and that during the active life of the pond at least one meter of liquid be maintained in the pond.

We are also proposing that no monitoring be required for this type of impoundment. We have received information and collected data that show there is no acceptable radon flux test method for a pond holding a large amount of liquid. (Method 115 does not work because a solid surface is needed to place the large area activated carbon canisters used in the Method). Further, even if there was an acceptable method, we recognize that radon emissions from the pond would be expected to be very low because the liquid acts as an effective barrier to radon emissions; given that radon-222 has a very short half-life (3.8 days), there simply is not enough time for most of the radon produced by the solids or from solution to migrate to the water surface and cross the water/air interface before decaying(EPA–HQ–OAR–2008–0218–0087). It therefore appears that monitoring at these ponds is not necessary for demonstrating compliance with the proposed standards. We do, however, ask for comment and supporting information on three issues: (1) Whether these impoundments need to be monitored with regard to their radon emissions, and why; (2) whether these impoundments need to be monitored to ensure at least one meter of liquid is maintained in the pond at all times, and (3) if these impoundments do need monitoring, what methods could a facility use (for example, what types of radon collection devices, or methods to measure liquid levels) at evaporation or holding ponds.

3. Heap Leach Piles

The final impoundment category for which we are proposing GACT standards is heap leach piles. We are proposing to require that heap leach piles meet the phased disposal work practice standard set out in Section III B. 1. of this preamble (which limits an owner/operator to no more than two operating heap leach piles of no more than 40 acres each at any time) and the design and construction requirements at 40 CFR 192.32(a)(1) as GACT. We are also requiring heap leach piles to maintain minimum moisture content of 30% so that the byproduct material in the heap leach pile does not dry out, which would increase radon emissions from the heap leach pile.

As noted earlier in the preamble, there are currently no operating uranium heap leach facilities in the United States. We are aware that the one currently proposed heap leach facility will use the design and operating requirements at 40 CFR 192.32(a)(1) for the design of its heap. Since this requirement will be used at the only example we have for a heap leach pile, it (design and operating requirements at 40 CFR 192.32(a)(1)), along with the phased disposal work practice standard (limiting the number and size of heap leach piles), will be the standards that we propose as GACT for heap leach piles. The premise is that the operator of a heap would not want to lose any of the uranium-bearing solution; thus, it is cost effective to maintain a good liner system so that there will be no leakage and ground water will be protected. Also, use of the phased disposal work practice standard will limit the amount of exposed uranium byproduct material that would be available to emit radon. If we assume that uranium ore (found in the heap leach pile) and the resultant leftover byproduct material after processing emit radon at the same rate as uranium byproduct material in a conventional impoundment (a conservative estimate), we can also assume that the radon emissions will be nearly the same as two 40 acre conventional impoundments.

We recognize that owners and operators of conventional impoundments also limit the amount of radon emitted by keeping the tailings in the impoundments covered, either with soil or liquids. At the same time, however, we recognize that keeping the uranium byproduct material in the heap in a saturated or near-saturated state (in order to reduce radon emissions) is not a practical solution as it would be at a conventional tailings impoundment. In the definitions at 40 CFR 61.251(c) we have defined ''dewatered'' tailings as those where the water content of the tailings does not exceed 30% by weight. We are proposing today to require operating heaps to maintain moisture content of greater than 30% so that the byproduct material in the heap is not allowed to become dewatered which would allow more radon emissions. We are specifically asking for comment on the amount of liquid that should be required in the heap, and whether the 30% figure is a realistic objective. We are also asking for comments on precisely where in the heap leach pile this requirement must be met. The heap leach pile may not be evenly saturated during the uranium extraction process. The sprayer/drip system commonly used on the top of heap leach piles usually results in a semi-saturated moisture condition at the top of the pile, since flow of the lixiviant is not uniformly spread across the top of the pile. As downward flow continues, the internal areas of the pile become saturated. We are requesting information and comment on where specifically in the pile the 30% moisture content should apply.

C. What are the monitoring requirements?

As the rule currently exists, only mills with existing conventional impoundments in operation on or prior to December 15, 1989, are currently required to monitor to ensure compliance with the radon flux standard. The reason for this is because at the time of promulgation of the 1989 rule, EPA stated that no flux monitoring would be required for new impoundments because the proposed

work practice standards would be effective in reducing radon emissions from operating impoundments by limiting the amount of tailings exposed (54 FR 51681). Since we have now determined that existing older conventional impoundments can meet one of the two work practice standards, we are proposing to eliminate the radon flux monitoring requirement.

In reviewing Subpart W we looked into whether we should extend radon monitoring to all affected sources constructed and operated after 1989 so that the monitoring requirement would apply to all conventional impoundments, non-conventional impoundments and heap leach piles containing uranium byproduct materials. We also reviewed how this requirement would apply to facilities where Method 115 is not applicable, such as at impoundments totally covered by liquids. We concluded that the original work practice standards (now proposed as GACT) continue to be an effective practice for the limiting of radon emissions from conventional impoundments and from heap leach piles. We also concluded that by maintaining an effective water cover on non-conventional impoundments the radon emissions from those impoundments are so low as to be difficult to differentiate from background radon levels at uranium recovery facilities. Therefore, we are proposing today that it is not necessary to require radon monitoring for any affected sources regulated under Subpart W. We seek comment on our conclusion that radon monitoring is not necessary for any of these sources as well as on any available cost-effective options for monitoring radon at non-conventional impoundments totally covered by liquids.

D. What are the notification, recordkeeping and reporting requirements?

New and existing affected sources are required to comply with the existing requirements of the General Provisions (40 CFR part 61, subpart A). The General Provisions include specific requirements for notifications, recordkeeping and reporting, including provisions for notification of construction and/or modification and startup as required by 40 CFR 61.07, 61.08 and 61.09.

Today we are also proposing that all affected sources will be required to maintain certain records pertaining to the design, construction and operation of the impoundments, both including conventional impoundments, and nonconventional impoundments, and heap leach piles. We are proposing that these records be retained at the facility and contain information demonstrating that the impoundments and/or heap leach pile meet the requirements in section 192.32(a)(1), including but not limited to, all tests performed that prove the liner is compatible with the material(s) being placed on the liner. For nonconventional impoundments we are proposing that this requirement would also include records showing compliance with the continuous one meter of liquid in the impoundment;[29] for heap leach piles, we are proposing that this requirement would include records showing that the 30% moisture content of the pile is continuously maintained. Documents showing that the impoundments and/or heap leach pile meet the requirements in section 192.32(a)(1) are already required as part of the pre-construction application submitted under 40 CFR 61.07, so these records should already be available. Records showing compliance with the one meter liquid cover requirement for nonconventional impoundments and records showing compliance with the 30% moisture level required in heap leach piles can be created and stored during the daily inspections of the tailings and waste retention systems required by the NRC (and Agreement States) under the inspection requirements of 10 CFR 40, Appendix A, Criterion 8A.

Because we are proposing new record-keeping requirements for uranium recovery facilities, we are required by the Paperwork Reduction Act (PRA) to prepare an estimate of the burden of such record-keeping on the regulated entity, in both cost and hours necessary to comply with the requirements. We have submitted the Information Collection Request (ICR) containing this burden estimate and other supporting documentation to the Office of Management and Budget (OMB). See Section VII.B for more discussion of the PRA and ICR.

We believe the record-keeping requirements proposed today will not create a significant burden for operators of uranium recovery facilities. As described earlier, we are proposing to require retention of three types of records: (1) Records demonstrating that the impoundments and/or heap leach pile meet the requirements in section 192.32(a)(1) (e.g. the design and liner testing information); (2) records showing that one meter of water is maintained to cover the byproduct material stored in nonconventional impoundments; and (3) records showing that heap leach piles maintain a moisture content of at least 30%.

Documents demonstrating that the affected sources comply with section 192.32(a)(1) requirements are necessary for the facility to obtain regulatory approval from NRC (or an NRC Agreement State) and EPA to construct and operate the affected sources (this includes any revisions during the period of operations). Therefore, these records will exist independent of Subpart W requirements and will not need to be continually updated as a result of this record-keeping requirement in Subpart W; however, we are proposing to include this record-keeping requirement in Subpart W to require that the records be maintained at the facility during its operational lifetime (in some cases the records might be stored at a location away from the facility, such as corporate offices). This might necessitate creating copies of the original records and providing a location for storing them at the facility.

Keeping a record to provide confirmation that water to a depth of one meter is maintained above the byproduct material stored in nonconventional impoundments should also be relatively straightforward. This would involve placement of a measuring device or devices in or at the edge of the impoundment to allow observation of the water level relative to the level of byproduct material in the impoundment. Such devices need not be highly technical and might consist of, for example, measuring sticks with easily-observable markings placed at various locations, or marking the sides of the impoundment to illustrate different water depths. As noted earlier, NRC and Agreement State licenses require operators to inspect the facility on a daily basis. Limited effort should be necessary to make observations of water depth and record the information in inspection log books that are already kept on site and available to inspectors.

Similarly, daily inspections would provide a mechanism for recording moisture content of heap leach piles. However, because no heap leach facilities are currently operating, there is more uncertainty about exactly how the operator will determine that the heap has maintained a 30% moisture content. As discussed in more detail in Section IV.E.4 of this preamble, soil moisture probes are readily available and could be used for this purpose. Such probes could be either left in the heap leach pile, placed at locations that provide a

[29] The one meter liquid requirement pertains to having one meter of liquid cover any and all solid byproduct material. We do not anticipate a large quantity of solid byproduct material in these nonconventional impoundments (EPA–HQ–OAR–2008–0218–0088).

representative estimate for the heap as a whole, or facility personnel could use handheld probes to collect readings. The facility might also employ mass-balance estimates to provide a further check on the data collected.

We estimate the burden in hours and cost for uranium recovery facilities to comply with the proposed recordkeeping requirements are as follows:

TABLE 1—BURDEN HOURS AND COSTS FOR PROPOSED RECORDKEEPING REQUIREMENTS

[Annual figures except where noted]

Activity	Hours	Costs
Maintaining Records for the section 192.32(a)(1) requirements	*20	*$1,360
Verifying the one meter liquid requirement for nonconventional impoundments	288	12,958
Verifying the 30% moisture content at heap leach piles using multiple soil probes	2,068	86,548

* These figures represent a one-time cost to the facility.

Burden levels for heap leach piles are most uncertain because they depend on the chosen method of measurement (e.g., purchasing and maintaining multiple probes or a smaller number of handheld units) as well as the personnel training involved (e.g., a person using a handheld unit will likely need more training than someone who is simply recording readings from already-placed probes). We request comment on our estimates of burden, as well as suggestions of methods that could readily and efficiently be used to collect the required information. More discussion of the ICR and opportunities for comment may be found in Section VII.B.

E. When must I comply with these proposed standards?

All existing affected sources subject to this proposed rule would be required to comply with the rule requirements upon the date of publication of the final rule in the **Federal Register**. To our knowledge, there is no existing operating uranium recovery facility that would be required to modify its affected sources to meet the requirements of the final rule; however, we request any information regarding affected sources that would not meet these requirements. New sources would be required to comply with these rule requirements upon the date of publication of the final rule in the **Federal Register** or upon startup of the facility, whichever is later.

IV. Rationale for This Proposed Rule

A. How did we determine GACT?

As provided in CAA section 112(d)(5), we are proposing standards representing GACT for this area source category. In developing the proposed GACT standards, we evaluated the control technologies and management practices that are available to reduce HAP emissions from the affected sources and identified those that are generally available and utilized by operating uranium recovery facilities.

As noted in Section II.F., for this proposal we solicited information on the available controls and management practices for this area source category using written facility surveys (surveys authorized by section 114(a) of the CAA), reviews of published literature, and reviews of existing facilities (EPA–HQ–OAR–0218–0066). We also held discussions with trade association and industry representatives and other stakeholders at various public meetings.[30] Our determination of GACT is based on this information. We also considered costs and economic impacts in determining GACT (See Section VI.).

We identified two general management practices that reduce radon emissions from affected sources. These general management practices are currently being used at all existing uranium recovery facilities. First, limiting the area of exposed tailings in conventional impoundments limits the amount of radon that can be emitted. The work practice standards currently included in Subpart W require owners and operators of affected sources to implement this management practice by either limiting the number and area of existing, operating impoundments or covering dewatered tailings to allow for no more than 10 acres of exposed tailings. This is an existing requirement of Subpart W and of the NRC licensing requirements; hence, owners and operators of uranium recovery facilities are already incurring the costs associated with limiting the area of conventional impoundments (and as proposed, heap leach piles) to 40 acres or less (as well as no more than two conventional impoundments in operation at any one time), or limiting the area of exposed tailings to no more than 10 acres.

Second, covering uranium byproduct materials with liquids is a general management practice that is an effective method for limiting radon emissions. This general management practice is often used at nonconventional impoundments, which, as stated earlier, are also known as evaporation or holding ponds. These nonconventional impoundments also contain byproduct material, and thus their HAP emissions are regulated under Subpart W. They are also regulated under the NRC operating license. While they hold mostly liquids, they are still designed and constructed in the manner of conventional impoundments, meaning they meet the requirements of section 192.32(a)(1). While this management practice of covering uranium byproduct materials in impoundments with liquids is not currently required under Subpart W, facilities using this practice have generally shown its effectiveness in reducing emissions in both conventional impoundments (that make use of phased disposal) and nonconventional impoundments (i.e. holding or evaporation ponds). We are therefore proposing to require the use of liquids in nonconventional impoundments as a way to limit radon emissions.

Therefore, after review of the available information and from the evidence we have examined, we have determined that a combination of the management practices listed above will be effective in limiting radon emissions from this source category, and will do so in a cost effective manner. We also believe that since heap leach piles are in many ways similar to the design of conventional impoundments, the same combination of work practices (limitation to no more than two operating heap leach piles, each one no more than 40 acres) will limit radon emissions in heap leach piles. We discuss our reasons supporting these conclusions in more detail in Section IV.B.

[30] See *http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html* for a list of presentations made at public meetings held by EPA and at various conferences open to the public.

B. Proposed GACT Standards for Operating Mill Tailings

1. Requirements at 40 CFR 192.32(a)(1)

As an initial matter, we determined that the requirements at 40 CFR 192.32(a)(1), which reference the RCRA requirements for the design and construction of liners at 40 CFR 264.221, continue to be an effective method of containment of tailings for all types of affected sources (EPA–HQ–OAR–2008–0218–0015). The liner requirements, described earlier in this document, remain in use for the permitting of hazardous waste land disposal units under RCRA. Because of the requirement for nearly impermeable boundaries between the tailings and the subsurface, and the requirement for leak detection between the liners, we have determined that the requirements contain enough safeguards to allow for the placement of tailings and also provide an early warning system in the event of a leak in the liner system (EPA–HQ–OAR–2008–0218–0015). For this reason we are proposing to require as GACT that conventional impoundments, non-conventional impoundments and heap leach piles all comply with the liner requirements in 40 CFR 192.32(a)(1). Previously, Subpart W contained this requirement but included a more general reference to 40 CFR 192.32(a); we are proposing to replace that general reference with a more specific reference to 40 CFR 192.32(a)(1) to narrow the requirements under this proposed rule to only the design and construction requirements for the liner of the impoundment contained in 40 CFR 192.32(a)(1).

The estimated average cost of the liner requirement for each type of impoundment at uranium recovery facilities is listed in the table below (EPA–HQ–OAR–2008–0218–0087):

TABLE 2—ESTIMATED LINER COSTS

Table 2—Proposed GACT standards costs per pound of U_3O_8

	Unit cost ($/lb U_3O_8)		
	Conventional	ISL	Heap Leach
GACT—Double Liners for Nonconventional Impoundments	$1.04	$3.07	$0.22
GACT—Maintaining 1 Meter of Water in Nonconventional Impoundments	0.013	0.010	0.0010
GACT—Liners for Heap Leach Piles	....	....	2.01
GACT—Maintaining Heap Leach Piles at 30% Moisture	....	....	0.0043
GACTs—Total for All Four	1.05	3.08	2.24

Table 2 presents a summary of the unit cost (per pound of U_3O_8) for implementing each GACT at each of the three types of uranium recovery facilities. In addition to presenting the GACT costs individually, Table 2 presents the total unit cost to implement all relevant GACTs at each type of facility.

Based on the Table 2, implementing all four GACTs would result in unit cost (per pound of U_3O_8) increases of about 2%, 6%, and 5% at conventional mills, ISL, and heap leach type uranium recovery facilities, respectively.

In making these cost estimates, we have assumed the following: (1) A conventional impoundment is no larger than 40 acres in size, which is the maximum size allowed for the phased disposal option; (2) a nonconventional impoundment is no larger than 80 acres in size (the largest size we have seen); and (3) a heap leach pile is no larger than 40 acres in size (again, the maximum size allowed under the phased disposal work practice standard, although as with conventional impoundments the owner or operator is limited to two of these affected sources to be in operation at any time).

We do not have precise data for the costs associated with the liner requirements at conventional impoundments using the continuous disposal work practice standard because currently none exist, but a reasonable maximum approximation would be the costs for the 80 acre nonconventional impoundment, since it is the largest we have seen. We believe that no additional costs would be incurred for building a conventional impoundment that will use the continuous disposal option above what we estimated for building a nonconventional impoundment but we ask for comment on whether this assumption is reasonable. We also ask for data on the costs of building a conventional impoundment using continuous disposal, and how those costs would differ from the estimates provided above, or whether the costs we have listed for building a conventional impoundment using phased disposal are a reasonable approximation of the costs for building a conventional impoundment using continuous disposal.

These liner systems are already required by 40 CFR 192.32(a)(1), which, as explained above, are requirements promulgated by EPA under UMTRCA that are incorporated into NRC regulations and implemented and enforced by NRC and NRC Agreement States through their licensing requirements. Therefore, we are not placing any additional liner requirements on facilities or requiring them to incur any additional costs to build their conventional or nonconventional impoundments or heap leach piles above and beyond what an owner or operator of these impoundments must already incur to obtain an NRC or NRC Agreement State license.

The liner systems we are proposing that heap leach piles must use are the same as those used for conventional and nonconventional impoundments. We estimate that the average costs associated with the construction of a 40 acre liner that complies with 40 CFR 192.32(a)(1)is approximately $15.3 million. When compared to the baseline capital costs associated with the facility (estimated at $356 million)(EPA–HQ–OAR–2008–0218–0087), the costs for constructing this type of liner system per facility is about 4% of the total baseline capital costs of a heap leach pile facility (EPA–HQ–OAR–2008–0218–0087).[31]

[31] For our purposes, baseline conditions are defined as a reference point that reflects the world without the proposed regulation. It is the starting point for conducting an economic analysis of the potential benefits and costs of a proposed regulation. The defined baseline influences first the level of emissions expected without regulatory intervention. It thereby also influences the projected level of emissions reduction that may be achieved as a consequence of the proposed regulation. Baselines have no standard definition besides the fact that they simply provide a reference scenario against which changes in economic and environmental conditions (in this case radon emissions) can be measured. In some instances, baselines have been established based on the assumption that economic, environmental and/or other conditions will continue on the present path or trend, purely as time dependant extensions of presently observed patterns. In other instances, baselines are derived from elaborate modeling

Continued

2. Conventional Impoundments

In the 1989 promulgation of Subpart W we required new conventional impoundments to comply with one of two work practice standards, phased disposal or continuous disposal. These work practice standards contain specific limits on the exposed area and/or number of operating conventional impoundments to limit radon emissions because we recognized that radon emissions from very large impoundments could impose unacceptable health effects if the piles were left dry and uncovered. We are proposing as the GACT standard that *all* conventional impoundments—both existing impoundments and new impoundments—comply with one of the two work practice standards, phased disposal or continuous disposal, because these methods for limiting radon emissions by limiting the area of exposed tailings continue to be effective methods for reducing radon emissions from these impoundments (reference EPA 520–1–86–009, August 1986). We are proposing that existing impoundments also comply with one of the two work practice standards because, as discussed earlier, we no longer believe that a distinction needs to be made for conventional impoundments based on the date when they were designed and/or constructed.

We are also not aware of any conventional impoundments either in existence or planned that use any other technologies or management practices to reduce radon emissions. Operators continue to use the general management practices discussed above for reducing radon emissions from their conventional impoundments, i.e., limiting the size and/or number of the impoundments, and covering the tailings with soil or keeping the tailings wet. These management practices form the basis of the work practice standards for conventional impoundments and continue to be very effective methods for limiting the amount of radon released to the environment.

These work practice standards are a cost-effective method for reducing radon emissions from conventional impoundments. In addition, the liner requirements for conventional impoundments are also required by the NRC in their licensing requirements at 10 CFR part 40. Therefore, we are proposing that GACT for conventional impoundments will be the same work practice standards as were previously included in Subpart W.

3. Non-Conventional Impoundments Where Tailings Are Contained in Ponds and Covered by Liquids

Today we are proposing a GACT standard specifically for use by any operating uranium recovery facility that has one or more non-conventional impoundments at its facility (i.e., those impoundments where tailings are contained in ponds and covered by liquids). Common names for these structures may include, but are not limited to, impoundments, evaporation ponds and holding ponds. These ponds contain uranium byproduct material and the HAP emissions are regulated by Subpart W.

Industry has argued in preambles to responses to the CAA section 114(a) letters [32] and elsewhere that Subpart W does not, and was never meant to, include these types of evaporation or holding ponds under the Subpart W requirements. Industry has asserted that the original Subpart W did not specifically reference evaporation or holding ponds but was regulating only conventional mill tailings impoundments. They argue that the ponds are temporary because they hold very little solid material but instead hold mostly liquids containing dissolved radionuclides (which emit very little radon), and at the end of the facility's life they are drained, and any solid materials, along with the liner system, are disposed in a properly licensed conventional impoundment.

EPA has consistently maintained that these non-conventional impoundments meet the existing applicability criteria for regulation under Subpart W. As defined at 40 CFR 61.251(g), uranium byproduct material or tailings means the waste produced by the extraction or concentration of uranium from any ore processed primarily for its source material content. The holding or evaporation ponds located at conventional mills, ISL facilities and potentially heap leach facilities contain uranium byproduct materials, either in solid form or dissolved in solution, and therefore their HAP emissions are regulated under Subpart W. Today we reiterate that position and are proposing a GACT standard more specifically tailored for these types of impoundments.

We are proposing that these non-conventional impoundments (the evaporation or holding ponds) must maintain a liquid level in the impoundment of no less than one meter at all times during the operation of the impoundment. Maintaining this liquid level will ensure that radon-222 emissions from the uranium byproduct material in the pond are minimized. We are also proposing that there is no maximum area requirement for the size of these ponds since the chance of radon emissions is small. Our basis for this determination is that radon emissions from the pond will be expected to be very low since the liquid in the ponds acts as an effective barrier to radon emissions; given that radon-222 has a very short half-life (3.8 days), there simply is not enough time for approximately 98% of the radon produced by the solids or from the solution to migrate to the water surface and cross the water/air interface before decaying.

By requiring a minimum of one meter of water in all nonconventional impoundments that contain uranium byproduct material, the release of radon from these impoundments would be greatly reduced. Nielson and Rogers (1986) present the following equation for calculating the radon attenuation:

$$A = e^{\left(-\left[\frac{\lambda}{D}\right]^{0.5} d\right)}$$

Where:

A = Radon attenuation factor (unit less)
λ = Radon-222 decay constant (sec^{-1})
= 2.1×10^{-6} sec^{-1}
D = Radon diffusion coefficient (cm^2/sec)
= 0.003 cm^2/sec in water
d = Depth of water (cm)
= 100 cm

The above equation indicates that the attenuation of radon emanation by water (i.e., the amount by which a water cover will decrease the amount of radon emitted from the impoundment) depends on how quickly radon-222 decays, how quickly radon-222 can move through water (the diffusion coefficient), and the thickness of the layer of water.[33] Solving the above equation shows that one meter of water has a radon attenuation factor of about 0.07. That is, emissions can be expected to be reduced by about 93% compared to no water cover.

The benefit incurred by this requirement is that significantly less radon will be released to the atmosphere. The amount varies from facility to facility based on the size of the nonconventional impoundment, but

projections. Because in all cases their purpose is to project a view of the world without the proposed regulatory intervention, baselines are sometimes termed ''do nothing'' or ''business as usual'' scenarios.

[32] *http://www.epa.gov/radiation/neshaps/subpartw/rulemaking-activity.html.*

[33] For a detailed discussion of this topic, which includes the effects of pond water mixing, wind and convection, please see ''Risk Assessment Revision for 40 CFR Part 61 Subpart W-Radon Emissions from Operating Mill Tailings, Task 5 Radon Emission from Evaporation Ponds,''(EPA–HQ–OAR–2008–0218–0080).

across existing facilities radon can be expected to be reduced by approximately 24,600 curies, a decline of approximately 93%.

The estimated cost associated with complying with the proposed one meter of liquid that would be required to limit the amount of radon emissions to the air vary according to the size of the impoundment and the geographic area in which it is located. We estimate that this requirement will cost owners or operators of 80 acre nonconventional impoundments between $1,042 and $9,687 per year. This value varies according to the location of the impoundment, which will determine evaporation rates, which determines how much replacement water will be required to maintain the minimum amount of one meter. If the evaporated water is not replaced by naturally occurring precipitation, then it would need to be replaced with make-up water supplied by the nonconventional impoundment's operator.

The most obvious source of water is what is known as ''process water'' from the extraction of uranium from the subsurface. Indeed, management of this process water is one of the primary reasons for constructing the impoundment in the first place, as the process water contains uranium byproduct material that must also be managed by the facility. It is possible that an operator could maintain one meter of water in the impoundment solely through the use of process water. If so, this would not create any additional costs for the facility as the cost of the process water can be attributed to its use in the uranium extraction process. However, for purposes of estimating the economic impacts associated with our proposal, our cost estimate does not include process water as a source of water potentially added to the impoundment to replace water that has evaporated. Instead, we estimated the costs of using water from other sources. This method results in the most conservative cost estimate for compliance with the one meter requirement.

In performing the cost impacts for this requirement, three potential sources of impoundment make-up water were considered: (1) Municipal water suppliers; (2) offsite non-drinking-water suppliers; and (3) on-site water (EPA–HQ–OAR–2008–0218–0087). Depending on the source of water chosen, we estimate that this requirement will cost owners or operators of nonconventional impoundments between $1,042.00 and $9,687.00 per year.[34]

This value also varies according to the size and location of the nonconventional impoundment. Such impoundments currently range up to 80 acres in size. The requirement to maintain a minimum of one meter of liquid in the ponds is estimated to cost approximately $0.03 per pound of uranium produced. The annual cost of makeup water was divided by the base case facility yellowcake annual production rate to calculate the makeup water cost per pound of yellowcake produced (EPA–HQ–OAR–2008–0218–0087). We conclude that this proposed requirement is a cost-effective way to significantly reduce radon emissions from nonconventional impoundments, and is therefore appropriate to propose as a GACT standard for nonconventional impoundments.

4. Heap Leach Piles

The final affected source type for which we are proposing GACT standards is heap leach piles. While there are currently no operating uranium heap leach facilities in the United States, we are proposing to regulate the HAP emission at any future facilities using this type of uranium extraction under Subpart W since the moment that uranium extraction takes place in the heap, uranium byproduct materials are left behind. During the process of uranium extraction on a heap, as the acid drips through the ore, uranium is solubilized and carried away to the collection system where it is further processed. At the point of uranium movement out of the heap, what remains is uranium byproduct materials as defined by 40 CFR 61.251(g). In other words, what remains in the heap is the waste produced by the extraction or concentration of uranium from ore processed primarily for its source material content. Thus, Subpart W applies because uranium byproduct materials are being generated during and following the processing of the uranium ore in the heap.

As a result, we are proposing GACT standards for heap leach piles. We are proposing that these piles conform to the phased disposal work practice standard specified for conventional impoundments in 40 CFR 61.252(a)(1)(i)(which limits the number of active heap leach piles to two, and limits the size of each one to no more than 40 acres) and that the moisture content of the uranium byproduct material in the heap leach pile be greater than or equal to 30% moisture content. We believe that the phased disposal approach can be usefully applied here because it limits the amount of tailings that can be exposed at any one time, which limits the amount of radon that can be emitted. The phased disposal work practice standard is applicable for heap leach piles because heap leach piles are expected to be managed in a manner that is similar in many respects to conventional impoundments. Based on what we understand about the operation of potential future heap leach facilities, after the uranium has been removed from the heap leach pile, the uranium byproduct material that remains would be contained in the heap leach structure which would be lined according to the requirements of 40 CFR 192.32(a)(1). The heap leach pile would also be covered with soil at the end of its operational life to minimize radon emissions.

This is what is required to occur at conventional impoundments using the phased disposal standard. Limiting the size of the operating heap leach pile to 40 acres or less (and the number of operating heap leach piles at any one time to two) has the same effect as it does on conventional impoundments; that is, it limits the area of exposed uranium byproduct material and therefore limits the radon emissions from the heap leach pile. While we believe that the 40 acre limitation is appropriate for heap leach piles, we are requesting comment on what should be the maximum size (area) of a heap leach pile.

We are also proposing as GACT that the heap leach pile constantly maintain a moisture content of at least 30% by weight. By requiring a moisture content of at least 30%, the byproduct material in the heap leach pile will not become dewatered, and we think that the heap leach pile will be sufficiently saturated with liquid to reduce the amount of radon that can escape from the heap leach pile. However, we request further information on all the chemical mechanisms in place during the leaching operation, and whether the 30% moisture content is sufficient for minimizing radon emissions from the heap leach pile. We also request comment on the amount of time the 30% moisture requirement should be maintained by a facility. We are proposing the term ''operational life'' of the facility. We are aware of several operations that take place during the

[34] Municipal sources were the most expensive, with average unit costs of $0.0033 per gallon. Offsite non-drinking water sources were the cheapest, at $0.000069 per gallon on average. Various references were used for the comparisons. For more detail, please see Section 6.3.3 of the Background Information Document.

uranium extraction process at a heap leach pile. After an initial period of several months of allowing lixiviant to leach uranium from the pile, the heap leach pile is allowed to ''rest,'' which enables the geochemistry in the pile to equilibrate. At that point the heap leach pile may be subjected to another round of extraction by lixiviant, or it may be rinsed to flush out any remaining uranium that is in solution in the heap leach pile. After the rinsing, the pile is allowed to drain and a radon barrier required by 40 CFR 192.32 can be emplaced. We are proposing that the operational life of the heap leach pile be from the time that lixiviant is first placed on the heap leach pile until the time of the final rinse. We believe this incorporates a majority of the time when the heap leach pile is uncovered (no radon barrier has been constructed over the top of the heap) and when the ability for radon to be emitted is the greatest.

Because there is no ''process water'' component to a heap leach operation, as there is for an ISL, water for the heap leach pile must be supplied from an outside source. Even if an ISL and heap leach operation were to be located at the same site, we consider it unlikely that an operator would use ISL process water as the basis for an acidic heap leach solution. It is possible, in fact likely, that the solution used in the heap will be recycled (i.e., applied to the heap more than once), which could reduce the amount of outside water needed to some degree, although as we discuss later in this section, it would not seem that recycling solution would affect the overall moisture content. In calculating the high-end costs of heap leaching, we have not included this possibility in our estimates of economic impacts.

The unit costs for providing liquids to a heap leach pile are assumed to be the same as the unit costs developed for providing water to nonconventional impoundments. In estimating the cost impacts for this requirement, three potential sources of impoundment make-up water were considered: (1) Municipal water suppliers; (2) offsite non-drinking-water suppliers; and (3) on-site water. The only cost associated with maintaining the moisture level within the pile is the cost of the liquid. We assume that existing piping used to supply lixiviant to the pile during leaching would be used to supply water necessary for maintaining the moisture level. Also, we assume that the facility will use the in-soil method for moisture monitoring. The in-soil method and its costs are described below.

Soil moisture sensors have been used for laboratory and outdoor testing purposes and for agricultural applications for over 50 years. They are mostly used to measure moisture in gardens and lawns to determine when it is appropriate to turn on irrigation systems. Soil moisture sensors can either be placed in the soil or held by hand.

For example, one system would bury soil moisture sensors to the desired depth in the heap. Then, a portable soil moisture meter would be connected by cable to each buried sensor one at a time, i.e., a single meter can read any number of sensors. The portable soil moisture meter costs about $350, and each in-soil sensor about $35 or $45, depending on the length of the cable (either 5 or 10 ft). Finally, it is assumed that moisture readings would be performed during the NRC required daily inspections of the heap leach pile, which would require approximately 2,000 additional work hours per year per facility. Our estimates for costs of monitoring the heap include 100 sensors located within the heap, with a meter on each sensor. We chose 100 sampling stations because heaps are generally the same size as conventional impoundments, and Method 115 prescribed 100 measurements for the tailings area of a conventional impoundment. The total estimated costs for using this system, including labor, are approximately $86,500 per year per facility.

Alternatively, with a handheld soil moisture meter, two rods (up to 8 inches long) that are attached to the meter are driven into the soil at the desired location, and a reading is taken. A handheld meter of this type costs about $1,065, and replacement rods about $58 for a pair. A minimum of 100 sampling stations for measuring radon could be required. We did not estimate costs for this method, as we concluded that the length of time required walking around a heap leach pile and obtaining these measurements required more time than is found in an average work day, and would expose workers to potentially hazardous constituents contained in the lixiviant.

The base case heap leach facility includes a heap leach pile that will occupy up to 80 acres at a height of up to 50 feet. With an assumed porosity of 0.39 and a moisture content of 30% by weight, the effective surface area of the liquid within the heap pile is 33.7 acres.

Table 3 presents the calculated cost for make-up water to maintain the moisture level in the heap leach pile, such that the moisture content is at 30% by weight, or greater. The unit costs for water and the net evaporation rates used for these estimates are identical to those derived for evaporation ponds.

TABLE 3—HEAP LEACH PILE ANNUAL MAKEUP WATER COST

Cost type	Water cost ($/gal)	Net evaporation (in/yr)	Makeup water cost ($/yr)	Makeup water rate (gpm/ft²)
Mean	$0.00010	45.7	$4,331	2.3E–05
Median	0.00010	41.3	3,946	2.1E–05
Minimum	0.000035	6.1	196	3.0E–06
Maximum	0.00015	96.5	13,318	4.8E–05

To place this amount of make-up water in perspective, during leaching and rinsing of the heap leach pile, liquid is dripped onto the pile at a rate of 0.005 gallons per minute per square foot (gpm/ft^2). This rate is significantly higher than the make-up water rates necessary to maintain the moisture content at 30% by weight, shown in Table 3. We conclude from this analysis that the leaching solution applied in a typical operation should be sufficient to maintain the moisture content of the heap leach pile to the required levels, and only in unusual circumstances (such as during the final rinse and draindown of the heap leach pile) would additional liquids need to be applied. However, in a circumstance that would require the additional application of liquid to maintain the 30% moisture limit, such as excessive evaporation, we estimate that the cost of requiring the owner/operator of a heap leach pile to maintain 30% moisture content in the pile will average approximately $4,000 per year.

We are asking for comment on exactly where in the pile the 30% moisture content should be achieved. We are also soliciting comments on whether the leaching operation itself liberates more radon into the air than the equivalent of a conventional impoundment. We assume that because low-grade ore is usually processed by heap leach, there would be less radon emitted from a heap leach pile than from a conventional impoundment of similar size. We request information on whether this is a correct assumption.

We are also aware that there could be a competing argument against regulating the heap leach pile under Subpart W while the lixiviant is being placed on the heap leach pile. While not directly correlative, the process of heap leach could be defined as active ''milling.'' The procedure being carried out on the heap is the extraction of uranium. In this view, the operation is focused on the production of uranium rather than on managing uranium byproduct materials. Therefore, under this view, the heap meets the definition of tailings under 40 CFR 61.251(g) only after the final rinse of the heap solutions occurs and the heap is preparing to close. In this scenario the heap leach pile would close under the requirements at 40 CFR part 192.32 and Subpart W would never apply. We are requesting comments on the relative merits of this interpretation.

It bears noting that, as with ISL facilities, collection and/or evaporation ponds (nonconventional impoundments) may exist at heap leach facilities that will also contain uranium byproduct materials. These ponds' HAP emissions will be regulated under Subpart W regardless of whether the heap leach pile is also subject to regulation under that subpart.

V. Other Issues Generated by Our Review of Subpart W

During our review of Subpart W we also identified several issues that need clarification in order to be more fully understood. The issues that we have identified are:

• Clarification of the term ''standby'' and how it relates to the operational phase of an impoundment;

• Amending the definition of ''operation'' of an impoundment so that it is clear when the owner or operator is subject to the requirements of Subpart W;

• Determining whether Subpart W adequately addresses protection from extreme weather events;

• Revising 40 CFR 61.252(b) and (c) to accurately reflect that it is only 40 CFR 192.32(a)(1)that is applicable to Subpart W; and

• Removing the phrase ''as determined by the Nuclear Regulatory Commission'' in 40 CFR 61.252(b)(1) and (2).

A. Clarification of the Term ''Standby''

There has been some confusion over whether the requirements of Subpart W apply to an impoundment that is in ''standby'' mode. This is the period of time that an impoundment may not be accepting tailings, but has not yet entered the ''closure period'' as defined by 40 CFR 192.31(h). This period of time usually takes place when the price of uranium is such that it may not be cost effective for the uranium recovery facility to continue operations, and yet the facility has not surrendered its operating license, and may re-establish operations once the price of uranium rises to a point where it is cost effective to do so. Since the impoundment has not entered the closure period, it could continue to accept tailings at any time; therefore, Subpart W requirements continue to apply to the impoundment. Today we are proposing to add a definition to 40 CFR 61.251 to define ''standby'' as:

Standby means the period of time that an impoundment may not be accepting uranium byproduct materials but has not yet entered the closure period.

B. Amending the Definition of ''Operation'' for a Conventional Impoundment

As currently written, 40 CFR 61.251(e) defines the operational period of a tailings impoundment. It states that ''operation'' means that an impoundment is being used for the continuing placement of new tailings or is in standby status for such placement (which means that as long as the facility has generated byproduct material at some point and placed it in an impoundment, it is subject to the requirements of Subpart W). An impoundment is in operation from the day that tailings are first placed in the impoundment until the day that final closure begins.

There has been some confusion over this definition. For example, a uranium mill announced that it was closing a pre-December 15, 1989, impoundment. Before initiating closure, however, it stated that it would keep the impoundment open to dispose of material generated by other closure activities at the site that contained byproduct material (liners, deconstruction material, etc) but not ''new tailings.'' The company argued that since it was not disposing of new tailings the impoundment was no longer subject to Subpart W. We disagree with this interpretation. While it may be true that the company was no longer disposing of new tailings in the impoundment, it has not begun closure activities; therefore, the impoundment is still open to disposal of byproduct material that emits radon and continues to be subject to all applicable Subpart W requirements.

To prevent future confusion, we are proposing today to amend the definition of ''operation'' in the Subpart W definitions at 40 CFR 61.251 as follows:

Operation means that an impoundment is being used for the continued placement of uranium byproduct material or tailings or is in standby status for such placement. An impoundment is in operation from the day that uranium byproduct materials or tailings are first placed in the impoundment until the day that final closure begins.

C. Weather Events

In the past, uranium recovery facilities have been located in the western regions of the United States. In these areas, the annual precipitation falling on the impoundment, and any drainage area contributing surface runoff to the impoundment, has usually been less than the annual evaporation from the impoundment. Also, these facilities have been located away from regions of the country where extreme rainfall events (e.g., hurricanes or flooding) could jeopardize the structural integrity of the impoundment, although there is a potential for these facilities to be affected by flash floods, tornadoes, etc. Now, however, uranium exploration and recovery in the U.S. has the potential to move eastward, into more climatologically temperate regions of the country, with south central Virginia being considered for a conventional uranium mill. In determining whether additional measures would be needed for impoundments operating in areas where precipitation exceeds evaporation, a review of the existing requirements was necessary.

The proposed revisions to Subpart W will continue to require owners and operators of all impoundments to follow the requirements of 40 CFR 192.32(a)(1). That particular regulation references the RCRA surface impoundment design and operations requirements of 40 CFR 264.221. At 40 CFR 264.221(g) and (h) are requirements that ensure proper design and operation of tailings impoundments. Section 264.221(g) states that impoundments must be designed, constructed, maintained and operated to prevent overtopping resulting from normal or abnormal operations; overfilling; wind and rain action (e.g., a two foot freeboard requirement); rainfall; run-on;

malfunctions of level controllers, alarms and other equipment; and human error. Section 264.221(h) states that impoundments must have dikes that are designed, constructed and maintained with sufficient structural integrity to prevent massive failure of the dikes. In ensuring structural integrity, it must not be presumed that the liner system will function without leakage during the active life of the unit.

Since impoundments at uranium recovery facilities have been and will continue to be required to comply with the requirements of 40 CFR 192.32(a)(1), they are already required to be designed to prevent failure during extreme weather events. As we stated in Section IV B.2., we believe the requirements of 40 CFR 192.32(a)(1) contain enough safeguards to allow for the placement of tailings and yet provide an early warning system in the event of a leak in the liner system. Therefore, we are proposing to include these requirements in the Subpart W requirements without modification.

D. Applicability of 40 CFR 192.32(a) to Subpart W

The requirements at 40 CFR 61.252(b) and (c) require compliance with 40 CFR 192.32(a). However, we are now proposing to focus the Subpart W requirements on the impoundment design and construction requirements found specifically at 40 CFR 192.32(a)(1). The remainder of 40 CFR 192.32(a) goes beyond this limited scope by including requirements for groundwater detection monitoring systems and closure of operating impoundments. These other requirements, along with all of the part 192 standards, are implemented and enforced by the NRC through its licensing requirements for uranium recovery facilities at 10 CFR part 40, Appendix A. However, when referenced in Subpart W, the requirements in 40 CFR 192.32(a)(1) would also be implemented and enforced by EPA as the regulatory authority administering Subpart W under its CAA authority. Therefore today we are proposing to revise 40 CFR 61.252 (b) and (c) to specifically define which portions of 40 CFR 192.32(a) are applicable to Subpart W. At the same time we are proposing to eliminate the phrase ''. . .as determined by the Nuclear Regulatory Commission'' from 40 CFR 61.252(b). This should eliminate confusion regarding what an applicant must submit to EPA under the CAA in its pre-construction and modification approval applications as required by 40 CFR 61.07, and better explain that EPA is the regulatory agency administering Subpart W under the CAA. This proposed change will have no effect on the licensing requirements of the NRC or its regulatory authority under UMTRCA to implement the part 192 standards through its licenses.

VI. Summary of Environmental, Cost and Economic Impacts

As discussed earlier, uranium recovery activities are carried out at several different types of facilities. We are proposing to revise Subpart W based on how uranium recovery facilities manage uranium byproduct materials during and after the processing of uranium ore at their particular facility. As discussed in Sections III and IV, we are proposing GACT requirements for three types of affected sources at uranium recovery facilities: (1) Conventional impoundments; (2) nonconventional impoundments; and (3) heap leach piles.

For purposes of analyzing the impacts of the proposed rule, we assumed that approximately five conventional milling facilities, 50 ISL facilities (although this is only a projection since only 12 currently exist) and one heap leach facility, each with at least one regulated impoundment, would become subject to the proposed rule. The following sections present our estimates of the proposed rule's air quality, cost and economic impacts. For more information, please refer to the Economic Impact Analysis report that is included in the public docket for this proposed rule (EPA–HQ–OAR–2008–0218–0087).

A. What are the air quality impacts?

We project that the proposed requirements will maintain or improve air quality surrounding the regulated facilities. The GACT standards being proposed today are based on control technologies and management practices that have been used at uranium recovery facilities for the past twenty or more years. These standards will minimize the amount of radon that is released to the air by keeping the impoundments wet or covered with soil and/or by limiting the area of exposed tailings. The requirements in this proposed rule should eliminate or reduce radon emissions at all three types of affected sources.

B. What are the cost and economic impacts?

Table 24 presents a summary of the unit cost (per pound of U_3O_8) for implementing each GACT at each of the three types of uranium recovery facilities. In addition to presenting the GACT costs individually, Table 24 presents the total unit cost to implement all relevant GACTs at each type of facility.

A reference facility for each type of uranium recovery facility is developed and described in Section 6.2, including the base cost estimate to construct and operate (without the GACTs) each of the three types of reference facilities. For comparison purposes, the unit cost (per pound of U_3O_8) of the three uranium recovery reference facilities is presented at the bottom of Table 4.

TABLE 4—PROPOSED GACT STANDARDS COSTS PER POUND OF U_3O_8

	Unit cost (\$/lb U_3O_8)		
	Conventional	ISL	Heap leach
GACT—Double Liners for Nonconventional Impoundments	\$1.04	\$3.07	\$0.22
GACT—Maintaining 1 Meter of Water in Nonconventional Impoundments	0.013	0.010	0.0010
GACT—Liners for Heap Leach Piles	....	....	2.01
GACT—Maintaining Heap Leach Piles at 30% Moisture	....	....	0.0043
GACTs—Total for All Four	1.05	3.08	2.24
Baseline Facility Costs (Section 6.2)	51.56	52.49	46.08

Based on the information in Table 24, implementing all four GACTs would result in unit cost (per pound of U_3O_8) increases of about 2%, 6%, and 5% at conventional, ISL, and heap leach type uranium recovery facilities, respectively.

The baseline costs were estimated using recently published cost data for actual uranium recovery facilities. For the model conventional mill, we used

data from the recently licensed new mill at the Piñon Ridge project in Colorado. For the model ISL facility, we used data from two proposed new facilities: (1) The Centennial Uranium project in Colorado; and (2) the Dewey-Burdock project in South Dakota. The Centennial project is expected to have a 14- to 15-year production period, which is a long duration for an ISL facility, while the Dewey-Burdock project is expected to have a shorter production period of about 9 years, which is more representative of ISL facilities. For the heap leach facility, we used data from the proposed Sheep Mountain project in Wyoming.

Existing Subpart W required facilities to perform annual monitoring using Method 115 to demonstrate that the radon flux standard at conventional impoundments constructed before December 15, 1989 was below 20 pCi/m^2-sec. The proposed removal of this monitoring requirement would result in a cost saving to the three facilities for which this requirement still applies: (1) Sweetwater; (2) White Mesa; and (3) Shootaring Canyon. Method 115 requires 100 measurements as the minimum number of flux measurements considered necessary to determine a representative mean radon flux value. For the three sites that are still required to perform Method 115 radon flux monitoring, the average annual cost to perform that monitoring is estimated to be about $9,730 for Shootaring and Sweetwater, and $19,460 for White Mesa. For all three sites the total annual average cost is estimated to be $38,920 per year, with a range from approximately $28,000 to $49,500 per year. For all three sites the total annual average cost savings resulting from removal of the flux monitoring requirement would be $39,920.

Baseline costs (explained in Section IV.B) for conventional impoundment liner construction [35] will remain the same, since the proposed rule does not impose additional requirements. Liners meeting the requirements at 40 CFR 192.32(a)(1) are already mandated by other regulations and, therefore, built into the baseline cost estimate. Therefore there are consequently no costs (or benefits) resulting from the inclusion of these requirements in Subpart W.

The average cost to construct one of these impoundments is $13.8 million. We estimate that this cost is approximately 3% of the total baseline capital costs to construct a conventional mill, estimated at $372 million.

We have estimated that for an average 80 acre nonconventional impoundment the average cost of construction of an impoundment is $23.7 million. Requiring impoundments to comply with the liner requirements in 40 CFR 192.32(a)(1) will contain the uranium byproduct material and reduce the potential for ground water contamination. The only economic impact attributable to the proposed rule is the cost of complying with the new requirement to maintain a minimum of one meter of water in the nonconventional impoundments during operation and standby. As shown in Section IV.B.3. of this preamble, as long as approximately one meter of water is maintained in the nonconventional impoundments the effective radon emissions from the ponds are so low that it is difficult to determine if there is any contribution above background radon values. In order to maintain one meter of liquid within a pond, it is necessary to replace the water that is evaporated from the pond. Depending on the source of water chosen,[36] we estimate that this requirement will cost owners or operators of nonconventional impoundments between $1,042 and $9,687 per year. This value also varies according to the size of the nonconventional impoundment, up to 80 acres, and the location of the impoundment. Evaporation rates vary by geographic location. However, the cost to maintain the one meter of liquid in a nonconventional impoundment is estimated to be less than 1% of the total annual production costs, estimated at $23.7 million. The requirement to maintain a minimum of one meter of liquid in the ponds is estimated to cost approximately $0.03 per pound of uranium produced.

Designing and constructing heap leach piles to meet the requirements at 40 CFR 192.32(a)(1) would minimize the potential for leakage of uranium enriched lixiviant into the ground water. Specifically, this would require that a double liner, with drainage collection capabilities, be provided under heap leach piles. Baseline costs (explained in Section IV.B) for heap leach pile liner construction will remain the same, since the proposed rule does not impose additional requirements. Liners meeting the requirements at 40 CFR 192.32(a)(1) are already mandated by other regulations and, therefore, built into the baseline cost estimate. Therefore there are consequently no costs (or benefits) resulting from the inclusion of these requirements in Subpart W. Baseline costs for construction will be essentially the same as for conventional impoundments. Since the liner systems are equivalent to the systems used for conventional and nonconventional impoundments, we have been able to estimate the average costs associated with the construction of heap leach pile impoundments that meet the liner requirements we are proposing, and compare them to the costs associated with the total production of uranium produced by the facility. The average cost of constructing such an impoundment is estimated to be approximately $15.3 million. The costs of constructing this type of liner system are about 4% of the estimated total baseline capital costs of a heap leach facility estimated at $356 million.

For heap leach piles, when the soil moisture content in the heap leach pile falls below about 30% by weight, the radon flux out of the heap leach pile increases because radon moves through the air faster (with less opportunity to decay) than through water. We concluded from our analysis that the leaching solution applied in a typical operation should be sufficient to maintain the moisture content of the heap leach pile to the required levels, and only in unusual circumstances would additional liquids need to be applied. However, in a circumstance that would require the additional application of liquid to maintain the 30% moisture limit, such as excessive evaporation, we estimate that the cost of requiring the owner/operator of a heap leach pile to maintain 30% moisture content in the pile will average approximately $4,000 per year. We also estimate that it will cost approximately $86,500 per year (which includes labor of approximately 2,000 hours) to perform the tests required to verify that the moisture content is being maintained. These costs are less than one percent of the total baseline capital costs of a heap leach facility, estimated at $356 million.

[35] These liner systems (conventional, nonconventional and heap leach piles)are already required by 40 CFR 192.32(a)(1), which, as explained above, are requirements promulgated by EPA under UMTRCA that are incorporated into NRC regulations and implemented and enforced by NRC through their licensing requirements. Therefore, we are not placing any additional liner requirements on facilities or requiring them to incur any additional costs to build their conventional or nonconventional impoundments or heap leach piles above and beyond what an owner or operator of these impoundments must already incur to obtain an NRC license. Therefore, there are no projected costs (or benefits) beyond the baseline resulting from the inclusion of these requirements in Subpart W.

[36] Municipal sources were the most expensive, with average unit costs of $0.0033 per gallon. Offsite non-drinking water sources were the cheapest, at $0.000069 per gallon on average. For more detail, please see Section 6.3.3 of the Background Information Document.

In summary, we estimate that for conventional impoundments there will be no additional costs incurred through this proposed rule. There will be a cost savings of approximately $39,900 per year for the three existing conventional impoundments that are currently required to monitor for radon flux through the use of Method 115, since we are proposing to eliminate this requirement. For nonconventional impoundments we estimate that the additional costs incurred by this proposed rule will be to maintain one meter of liquid in each nonconventional impoundment, and we have estimated those costs between approximately $1,040 and $9,680 per year. For heap leach piles, additional costs incurred by this proposed rule would be for the maintaining and monitoring of the continuous 30% moisture content requirement, which we estimate will impose a one-time cost of approximately $35,000 for equipment and approximately $86,000 per year to monitor the moisture content.

C. What are the non-air environmental impacts?

Water quality would be maintained by implementation of this proposed rule. This proposed rule does contain requirements (by reference) related to water discharges and spill containment. In fact, the liner requirements cross referenced at 40 CFR 192.32(a)(1) will significantly decrease the possibility of contaminated liquids leaking from impoundments into ground water (which can be a significant source of drinking water). Section 192.32(a)(1) includes a cross-reference to the surface impoundment design and construction requirements of hazardous waste surface impoundments regulated under the Resource Conservation and Recovery Act (RCRA), found at 40 CFR 264.221. Those requirements state that the impoundment shall be designed, constructed and installed to prevent any migration of wastes out of the impoundment to the adjacent subsurface soil or ground water or surface water at any time during the active life of the impoundment. There are other requirements for the design and operation of the impoundment, and these include construction specifications, slope requirements, sump and liquid removal requirements.

These liner systems (conventional, nonconventional and heap leach piles)are already required by 40 CFR 192.32(a)(1), which, as explained above, are requirements promulgated by EPA under UMTRCA that are incorporated into NRC regulations and implemented and enforced by NRC through their licensing requirements. Therefore, we are not placing any additional liner requirements on facilities or requiring them to incur any additional costs to build their conventional or nonconventional impoundments or heap leach piles above and beyond what an owner or operator of these impoundments must already incur to obtain an NRC license.

Including a double liner in the design of all onsite impoundments that would contain uranium byproduct material would reduce the potential for ground-water contamination. Although the amount of the potential reduction is not quantifiable, it is important to take this into consideration due to the significant use of ground water as a source of drinking water.

VII. Statutory and Executive Orders Review

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), this action is a ''significant regulatory action.'' The Executive Order defines ''significant regulatory action'' as one that is likely to result in a rule that may ''raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.'' Accordingly, EPA submitted this action to the Office of Management and Budget (OMB) for review under Executive Orders 12866 and 13563 (76 FR 3821, January 21, 2011) and any changes made in response to OMB recommendations have been documented in the docket for this action.

B. Paperwork Reduction Act

The information collection requirements in this proposed rule have been submitted for approval to the Office of Management and Budget (OMB) under the *Paperwork Reduction Act,* 44 U.S.C. 3501 *et seq.* The Information Collection Request (ICR) document prepared by EPA has been assigned EPA ICR number 2464.01.

The information to be collected for the proposed rulemaking today is based on the requirements of the Clean Air Act. Section 114 authorizes the Administrator of EPA to require any person who owns or operates any emission source or who is subject to any requirements of the Act to:

—Establish and maintain records
—Make reports, install, use, and maintain monitoring equipment or method
—Sample emissions in accordance with EPA-prescribed locations, intervals and methods
—Provide information as may be requested

EPA's regional offices use the information collected to ensure that public health continues to be protected from the hazards of radionuclides by compliance with health based standards and/or Generally Available Control Technology (GACT).

The proposed rule would require the owner or operator of a uranium recovery facility to maintain records that confirm that the conventional impoundment(s), nonconventional impoundment(s) and heap leach pile(s) meet the requirements in section 192.32(a)(1). Included in these records are the results of liner compatibility tests, measurements confirming that one meter of liquid has been maintained in nonconventional impoundments and records confirming that heap leach piles have constantly maintained at least 30% moisture content during the operating life of the heap leach pile. This documentation should be sufficient to allow an independent auditor (such as an EPA inspector) to verify the accuracy of the determination made concerning the facility's compliance with the standard. These records must be kept at the mill or facility for the operational life of the facility and, upon request, be made available for inspection by the Administrator, or his/her authorized representative. The proposed rule would not require the owners or operators of operating impoundments and heap leach piles to report the results of the compliance inspections or calculations required in Section 61.255. The recordkeeping requirements require only the specific information needed to determine compliance. We have taken this step to minimize the reporting requirements for small business facilities.

The annual proposed monitoring and recordkeeping burden to affected sources for this collection (averaged over the first three years after the effective date of the proposed rule) is estimated to be 10,400 hours with a total annual cost of $400,000. This estimate includes a total capital and start-up cost component annualized over the facility's expected useful life, a total operation and maintenance component, and a purchase of services component. We estimate that this total burden will be spread over 21 facilities that will be required to keep records. Of this total burden, however, 4,150 hours (and $93,000) will be incurred by the one heap leach uranium recovery facility,

due to the requirements for purchasing, installing and monitoring the soil moisture sensors, as well as training staff on how to operate the equipment.

Burden is defined at 5 CFR 1320.3(b). An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in 40 CFR are listed in 40 CFR part 9.

To comment on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, EPA has established a public docket for this rule, which includes this ICR, under Docket ID number EPA–HQ–OAR–2008–0218. Submit any comments related to the ICR to EPA and OMB. See **ADDRESSES** section at the beginning of this notice for where to submit comments to EPA. Send comments on the ICR to OMB to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street NW., Washington, DC 20503, Attention: Desk Office for EPA. Since OMB is required to make a decision concerning the ICR between 30 and 60 days after May 2, 2014, a comment to OMB is best assured of having its full effect if OMB receives it by June 2, 2014. The final rule will respond to any OMB or public comments on the information collection requirements contained in this proposal.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of today's rule on small entities, small entity is defined as: (1) A small business whose company has less than 500 employees and is primarily engaged in leaching or beneficiation of uranium, radium or vanadium ores as defined by NAIC code 212291; (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.

After considering the economic impacts of this proposed rule on small entities, I certify that this action will not have a significant economic impact on a substantial number of small entities. This proposed rule is estimated to impact approximately 18 uranium recovery facilities that are currently operating or plan to operate in the future.

To evaluate the significance of the economic impacts of the proposed revisions to Subpart W, separate analyses were performed for each of the three proposed GACTs.

The GACT for uranium recovery facilities that use conventional milling techniques proposes that only phased disposal units or continuous disposal units be used to manage the tailings. For either option, the disposal unit must be lined and equipped with a leak detection system, designed in accordance with part 192.32(a)(1). If phased disposal is the option chosen, the rule limits the disposal unit to a maximum of 40 acres, with no more than two units open at any given time. If continuous disposal is chosen, no more than 10 acres may be open at any given time. Finally, the Agency is proposing to eliminate the distinction that was made in the 1989 rule between impoundments constructed pre-1989 and post-1989 since all of the remaining pre-1989 impoundments comply with the proposed GACT. The elimination of this distinction also eliminates the requirement that pre-1989 disposal units be monitored on an annual basis to demonstrate that the average Rn-222 flux does not exceed 20 $pCi/m^2/sec$.

The conventional milling GACT applies to three existing mills and one proposed mill that is in the process of being licensed. The four conventional mills are: the White Mesa mill owned by Energy Fuels Resources (USA); the Shootaring Canyon mill owned by Uranium One, Inc.; the Sweetwater mill owned by Kennecott Uranium Co.; and the proposed Piñon Ridge mill owned by Energy Fuels, Inc. Of the three companies that own conventional mills, none are classified as small businesses using fewer than 500 employees as the classification criterion.

Energy Fuels White Mesa mill uses a phased disposal system that complies with the proposed GACT. When its existing open unit is full it will be contoured and covered and a new unit, constructed in accordance with the proposed GACT, will be opened to accept future tailings. Energy Fuels is proposing a phased disposal system to manage its tailings; this system also complies with the proposed GACT.

Based on the fact that both small entities are in compliance with the proposed GACT, we conclude that the rulemaking will not impose any new economic impacts on either facility. For Energy Fuels Mines, the proposed rule will actually result in a cost saving as it will no longer have to perform annual monitoring to determine the average radon flux from its impoundments.

The GACT for evaporation ponds at uranium recovery facilities requires that the evaporation ponds be constructed in accordance with design requirements in part 192.32(a)(1) and that a minimum of 1 meter of liquid be maintained in the ponds during operation and standby. The key design requirements for the ponds are for a double-liner with a leak detection system between the two liners.

In addition to the four conventional mills identified above, the GACT for evaporation ponds applies to in-situ leach facilities and heap leach facilities. Currently, there are five operating ISL facilities and no operating heap leach facilities. The operating ISLs are Crow Butte and Smith Ranch owned by Cameco Resources, Alta Mesa owned by Mestena Uranium, LLC, Willow Creek owned by Uranium One, Inc., and Hobson owned by Uranium Energy Corp. Again using the fewer than 500 employees' criterion, Mestena Uranium, LLC and Uranium Energy Corp are both small businesses, while Cameco Resources and Uranium One, Inc. are both large businesses.

All of the evaporation ponds at the four conventional mills and the five ISL facilities were built in conformance with part 192.32(a)(1). Therefore, the only economic impact is the cost of complying with the new requirement to maintain a minimum of 1 meter of water in the ponds during operation and standby.

The proposed revisions to Subpart W apply to five currently operating ISL facilities. The operating facilities are Crow Butte (Nebraska) and Smith Ranch (Wyoming), owned by Cameco Resources; Alta Mesa (Texas), owned by Mestena Uranium, LLC; Willow Creek (Wyoming), owned by Uranium One, Inc.; and Hobson (Texas), owned by Uranium Energy Corp. Again using the fewer than 500 employees' criterion, Mestena Uranium, LLC and Uranium Energy Corp are both small businesses, while Cameco Resources and Uranium One, Inc. are both large businesses.

In addition to the five operating ISL facilities, three additional ISL facilities have been licensed, all in the state of Wyoming. These are: Lost Creek, owned by Ur-Energy Inc.; Moore Ranch, owned by Uranium One, Inc.; and Nichols Ranch, owned by Uranerz Uranium Corp. Of these three companies, both Ur-Energy Inc. and Uranerz Uranium Corp. are small businesses.

Eleven other ISL facilities have been proposed for licensing. These include: Dewey-Burdock (South Dakota) and Centennial (Colorado), both owned by Powertech Uranium Corp.; and Kingsville Dome, Los Finados, Rosito, and Vasques (Texas), all owned by Uranium Resources Inc.; Crownpoint (New Mexico), also owned by Uranium Resources Inc., Church Rock (New Mexico), owned by Strathmore Minerals; Ross (Wyoming), owned by Strata Energy, Inc., Goliad (Texas), owned by Uranium Energy Corp.; and Antelope-Jab (Wyoming), owned by Uranium One, Inc. All of these companies, except for Uranium One, Inc. are small businesses.

According to the licensing documents submitted by the owners of the proposed ISL facilities, all will be constructed in conformance with part 192.32(a)(1). Therefore the only economic impact is the cost of complying with the new requirement to maintain a minimum of 1 meter of water in the ponds during operation and standby.

The requirement to maintain a minimum of 1 meter of liquid in the ponds is estimated to cost up to $0.03 per pound of U_3O_8 produced. This cost is not a significant impact on any of these small entities.

Although there are no heap leach facilities currently licensed, Energy Fuels, Inc. is expected to submit a licensing application for the Sheep Mountain Project. From the preliminary documentation that Titan presented (now owned by Energy Fuels), the facility will have an Evaporation Pond, a Collection Pond, and a Raffinate Pond. All three ponds will be double lined with leak detection. However, as Energy Fuels is a large business, it does not affect the determination of impacts on small businesses.

The GACT for heap leach facilities applies the phased disposal option of the GACT for conventional mills to these facilities and adds the requirement that the heap leach pile be maintained at a minimum 30 percent moisture content by weight during operations.

As noted previously, there are no heap leach facilities currently in existence, and the only one that is known to be preparing to submit a license application is being proposed by Energy Fuels, which is a large business.

Of the 20 facilities identified above, 15 are owned by small businesses. No small organizations or small governmental entities have been identified that would be impacted by the proposed GACTs. We continue to be interested in the potential impacts of the proposed rule on small entities and welcome comments on issues related to such impacts.

D. Unfunded Mandates Reform Act

This rule does not contain a Federal mandate that may result in expenditures of $100 million or more for State, local and tribal governments, in the aggregate, or the private sector in any one year. The proposed rule imposes no enforceable duties on any State, local or Tribal governments or the private sector. Thus, this rule is not subject to the requirements of sections 202 or 205 of UMRA.

This rule is also not subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments because it contains no requirements that apply to such governments nor does it impose obligations upon them.

E. Executive Order 13132: Federalism

This proposed rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. None of the facilities subject to this action are owned and operated by State governments, and, nothing in the proposed rule will supersede State regulations. Thus, Executive Order 13132 does not apply to this proposed rule.

In the spirit of Executive Order 13132 and consistent with EPA policy to promote communications between EPA and State and local governments, EPA specifically solicits comment on this proposed rule from State and local officials.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, November 9, 2000). The action imposes requirements on owners and operators of specified area sources and not tribal governments. Thus, Executive Order 13175 does not apply to this action.

EPA specifically solicits additional comment on this proposed action from tribal officials.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

EPA interprets EO 13045 (62 FR 19885, April 23, 1997) as applying to those regulatory actions that concern health or safety risks, such that the analysis required under section 5–501 of the Order has the potential to influence the regulation. This action is not subject to EO 13045 because it is based solely on technology performance.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not a ''significant energy action'' as defined in Executive Order 13211 (66 FR 28355 (May 22, 2001)), because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. This proposed rule will not adversely directly affect productivity, competition, or prices in the energy sector.

I. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act of 1995 (''NTTAA''), Public Law 104–113, 12(d) (15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (e.g., materials specifications, test methods, sampling procedures, and business practices) that are developed or adopted by voluntary consensus standards bodies. NTTAA directs EPA to provide Congress, through OMB, explanations when the Agency decides not to use available and applicable voluntary consensus standards. This proposed rulemaking does not involve technical standards. Therefore, EPA is not considering the use of any voluntary consensus standards.

We request public comment on this aspect of the proposed rulemaking, and specifically, ask you to identify potentially applicable voluntary consensus standards and to explain why such standards could be used in this regulation.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898 (59 FR 7629 (Feb. 16, 1994)) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

EPA has determined that this proposed rule will not have disproportionately high and adverse human health or environmental effects on minority or low-income populations because it increases the level of environmental protection for all affected populations without having any disproportionately high and adverse human health or environmental effects on any population, including any minority or low-income population. This proposed rule would reduce toxics emissions of radon from nonconventional impoundments and heap leach piles and thus decrease the amount of such emissions to which all affected populations are exposed.

List of Subjects in 40 CFR Part 61

Environmental protection, Air pollution control, Hazardous substances, Radon, Tailings, Byproduct, Uranium, Reporting and recordkeeping requirements.

Dated: April 17, 2014.

Gina McCarthy,

Administrator.

For the reasons stated in the preamble, the Environmental Protection Agency proposes to amend title 40, Chapter I of the Code of Federal Regulations as follows:

PART 61—[NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS]

■ 1. The authority citation for part 61 continues to read as follows:

Authority: 42 U.S.C. 7401 et seq.

Subpart W—[National Emission Standards for Radon Emissions From Operating Mill Tailings]

■ 2. Section 61.251 is amended by revising the definition for (e) and adding new definitions for (h–m) as follows:

§ 61.251 Definitions.

* * * * *

(e) *Operation.* Operation means that an impoundment is being used for the continued placement of uranium byproduct materials or tailings or is in standby status for such placement. An impoundment is in operation from the day that uranium byproduct materials or tailings are first placed in the impoundment until the day that final closure begins.

* * * * *

(h) *Conventional Impoundment.* A conventional impoundment is a permanent structure located at any uranium recovery facility which contains mostly solid uranium byproduct material from the extraction of uranium from uranium ore. These impoundments are left in place at facility closure.

(i) *Non-Conventional Impoundment.* A non-conventional impoundment can be located at any uranium recovery facility and contains uranium byproduct material suspended in and/or covered by liquids. These structures are commonly known as holding ponds or evaporation ponds. They are removed at facility closure.

(j) *Heap Leach Pile.* A heap leach pile is a pile of uranium ore placed on an engineered structure and stacked so as to allow uranium to be dissolved and removed by leaching liquids.

(k) *Standby.* Standby means the period of time that an impoundment may not be accepting uranium byproduct materials but has not yet entered the closure period.

(l) *Uranium Recovery Facility.* A uranium recovery facility means a facility licensed by the NRC or an NRC Agreement State to manage uranium byproduct materials during and following the processing of uranium ores. Common names for these facilities are a conventional uranium mill, an in-situ leach (or recovery) facility and a heap leach facility or pile.

(m) *Heap Leach Pile Operational Life.* The operational life of a heap leach pile means the time that lixiviant is first placed on the heap leach pile until the time of the final rinse.

■ 3. Section 61.252 is revised to read as follows:

§ 61.252 Standard.

(a) Conventional Impoundments.

(1) Conventional impoundments shall be designed, constructed and operated to meet one of the two following management practices:

(i) *Phased disposal* in lined tailings impoundments that are no more than 40 acres in area and shall comply with the requirements of 40 CFR 192.32(a)(1). The owner or operator shall have no more than two conventional impoundments, including existing impoundments, in operation at any one time.

(ii) *Continuous disposal* of tailings such that tailings are dewatered and immediately disposed with no more than 10 acres uncovered at any time and shall comply with the requirements of 40 CFR 192.32(a)(1).

(b) *Non-Conventional Impoundments.* Non-conventional impoundments shall meet the requirements of 40 CFR 192.32(a)(1). During operation and until final closure begins, the liquid level in the impoundment shall not be less than one meter.

(c) *Heap Leach Piles.* Heap leach piles shall comply with the phased disposal management practice in 40 CFR 61.252(a)(1)(i). Heap leach piles shall be constructed in lined impoundments that are no more than 40 acres in area and shall comply with the requirements of 40 CFR 192.32(a)(1). The owner or operator shall have no more than two heap leach piles, including existing heap leach piles, in operation at any one time. The moisture content of heap leach piles shall be maintained at 30% or greater. The moisture content shall be determined on a daily basis, and performed using generally accepted geotechnical methods. The moisture content requirement shall apply during the heap leach pile operational life.

§ 61.253 [Removed]

■ 4. Section 61.253 is removed.

§ 61.254 [Removed]

■ 5. Section 61.254 is removed.

■ 6. Section 61.255 is revised to read as follows:

§ 61.255 Recordkeeping requirements.

(a) The owner or operator of any uranium recovery facility must maintain records that confirm that the conventional impoundment(s), nonconventional impoundment(s) and heap leach pile(s) at the facility meet the requirements in 40 CFR 192.32(a)(1). These records shall include, but not be limited to, the results of liner compatibility tests.

(b) The owner or operator of any uranium recovery facility with nonconventional impoundments must maintain records that include measurements confirming that one meter of liquid has been maintained in the nonconventional impoundments at the facility.

(c) The owner or operator of any heap leach facility shall maintain records confirming that the heap leach piles maintained at least 30% moisture content by weight during the heap leach pile operational life.

(d) The records required in paragraphs (a), (b) and (c) above must be kept at the uranium recovery facility for the operational life of the facility and must be made available for inspection by the Administrator, or his authorized representative.

June 12, 2014

Reid J. Rosnick
Office of Radiation and Indoor Air
Radiation Protection Division
U.S. Environmental Protection Agency
Via email to rosnick.reid@epa.gov

Dear Mr. Rosnick,

The National Tribal Air Association (NTAA) is an autonomous organization with 80 principal member Tribes. The organization's mission is to advance air quality management policies and programs, consistent with the needs, interests, and unique legal status of Indian Tribes. As such, the NTAA uses its resources to support the efforts of all federally recognized Tribes in protecting and improving the air quality within their respective jurisdictions.

On behalf of the NTAA, I am writing to request that EPA extend the public comment period for the proposed rule issued in the Federal Register on May 2, 2014, which would revise Subpart W of 40 CFR Part 61, "*National Emission Standards for Operating Uranium Mill Tailings*". Specifically, the *NTAA is requesting the maximum comment extension period of 120 days*.

This rule addresses both conventional uranium milling operations as well as future extraction activities, namely in-situ leach/recovery (ISL) sites. Domestic uranium milling and mining operations to date have left in their wake a disturbing legacy of environmental injustice in Indian Country. As a national organization whose mission it is to advance air quality management and policies for federally recognized Tribes, it is only prudent that NTAA thoroughly evaluate the consequences of the proposed rule, including the potential impacts on Tribal communities, and subsequently provide comments to EPA. Given the serious complexity of the proposed rule, as well as the wide ranging implications for affected tribes, we strongly request that you grant the aforementioned extension.

For our part, NTAA was only made aware of the proposed rule within the last two weeks. The public comment extension will help to promote a just and equitable public participation process by giving the NTAA, member tribes, and those Tribes indicated on EPA's consultation list adequate time to examine the complex science and the associated human health considerations embodied in the proposed rule.

Sincerely,

Bill Thompson
Chairman, NTAA

Re: Request for Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick:

REQUEST FOR EXTENSION OF TIME TO SUBMIT COMMENTS

Uranium Watch requests a 60-day extension of the time period to submit comments on the Environmental Protection Agency's (EPA's) Proposed Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings, 49 C.F.R. Part 61 Subpart W, Docket ID No. EPA–HQ– OAR–2008–0218. 79 Fed. Reg. 25388, May 2, 2014.

The request for a 60-day extension of time is based on the following.

Proposed Subpart W Factual Bases: One of the EPA's primary reasons for the proposed elimination of the requirement for radon monitoring and reporting at "existing" mill tailings impoundments (as defined in 40 C.F.R. § 61.251(d)) is the claim that the existing tailings impoundment at the Shootaring Canyon Mill (Garfield County, Utah) has a "synthetic liner." This claim is not supported by a citation in the proposed rule or

documentation in the Rulemaking Docket. The fact is that the tailings impoundment for the Shootaring Canyon Mill has a clay liner, not a synthetic liner.[1] This reality means that the EPA has a very shaky factual basis for its determination that, soon, any "existing" conventional tailings impoundments will all meet the standard in 10 C.F.R. § 61.252(b)(1), and, therefore, it is appropriate to eliminate any requirement for radon monitoring at "existing" tailings impoundments.

This incorrect factual claim regarding the Shootaring Canyon Mill and other misinformation, misleading information, incomplete information, and outdated information require a commenter to carefully review the proposed rule and supporting documents. Also, the EPA has asked for commenters' thoughts on various aspects of the proposed rule. These lengthy and detailed research and comment preparations require additional time in order to frame informed comments.

REQUEST FOR HEARING

I would also request a hearing on Subpart W rulemaking at White Mesa, San Juan County. I will be out of state from mid-June until the week of July 27, so request a hearing at White Mesa after July 27, 2014. Therefore, additional time for comments and hearings are necessary.

Thank you for consideration of this request.

Sincerely,

Sarah Fields

I had mentioned Subpart W Proposed revision on an earlier NTAA call. Andy Bessler from NTAA followed up with NTAA tribes. Twa-le Abrahmason-Swan from Spokane tribe is interested and is pulling NTAA in. I really didn't expect NTAA get involved, but it is good that they see themselves connecting with (as Twa-le say's it) the R in OAR.

Subject: RE: Draft NTAA Extension Request on EPA draft rule on radon emissions from Uranium Mills

Thank you for catching this one. We are one of many Tribes dealing with uranium mines and mills, it has been extremely difficult finding expertise within EPA and within certain regions, like 10 on regulations like this. A formalized working/technical assistance group for Tribes would be extremely helpful. We need more help with the "R" in ORIA.

Here's an article from the Ute Mtn Ute Tribe, the mining company operating on our Reservation is in negotiations with this mill to accept and process the waste from the water treatment plant at Midnite Mine.
http://fourcornersfreepress.com/?p=575

I've also attached a picture summary of activities at the Dawn Millsite for 2013. One thing we are dealing with, and is a concern to Tribal members in our community is the continued taking of clean lands for fill materials to cover these sites. Their estimates are too low to meet current radon guidelines, they have to keep adding more and more topsoil. Newmont Mining Co, continues to buy fee lands on and adjacent to the Spokane Reservation for fill material and they are clear-cutting lands and basically mining more topsoil. The pond in the photos needed double the amount of soil cover they planned for. For the Midnite Mine cleanup, they are only estimating 3 feet of topsoil to cover the entire site, it seems like a very low estimate.

http://www.spokesman.com/stories/2014/apr/28/spokane-tribe-members-want-more-time-to-review/

I'd like to help with this one, and hopefully learn more in the process. There is also a new regulation on waste transport that has interest to Tribes. I haven't got far trying to track information down on this one either, I was trying to ask them how Tribes need to participate to start getting this notification.

Materials rules - advance notice to tribal governments On April 7, 2014, the department adopted the federal Nuclear Regulatory Commission's rule change titled "2012-2: Advance notification to Native American tribes of transportation of certain types of nuclear waste."

CR103 Rule-Making Order (PDF).
Final rule language (PDF).

Effective May 8, 2014, these changes amend rules that govern packaging and transportation of radioactive material and physical protection of plants and materials. The amendments require

licensees to give advance notice to participating federally recognized tribal governments about shipments of irradiated reactor fuel and certain nuclear wastes that pass within or across their reservations.
If you have any questions about the proposed rule changes, contact Curt DeMaris, Radiation Health Physicist, Materials Section, at 360-236-3223.

Dawn Millsite October 2013

2013 Dawn Millsite Construction/Investigation Activities Information

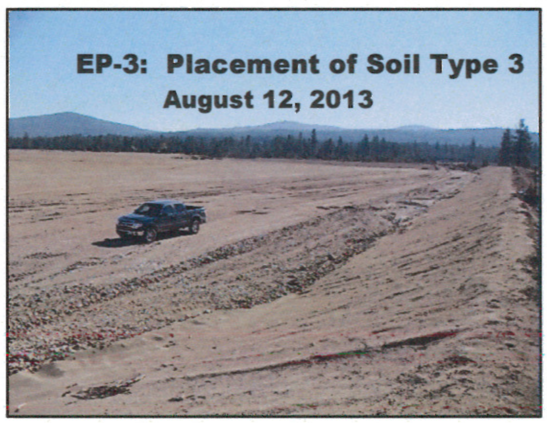
All work completed in 2013 unless noted.

Evaporation Ponds EP-2, 3, and 4 were cleaned and decommissioned

- EP-2 is 28.3 acres - cleaning from July to October
- EP-3 is 16.9 acres - cleaning from May to June
- EP-4 is 12.7 acres – cleaning from June to July

Radon Barrier soil placement over TDA 1-3 in EP-2, 3, and 4

- Construction - June through November;
- 656,847 cy soil placed through November 20.
- Average 6.5-foot thickness of soil over 61 acres.
- Approximately 42% of total TDA 1-3 cover installed.



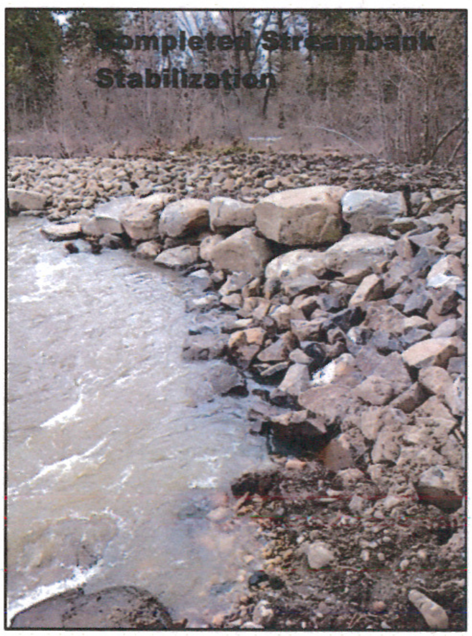
EP-6 Construction

- Four double-lined cells with leak detection; 120 ac-feet total storage capacity
- Construction started May 2013 and completed August 2013.
- 87,000 cy of fill excavated and placed to construct embankments; 10,600 cy bedding sand

- 638,000 sf of primary and secondary HDPE liner and geogrid
- Started filling with EP-2 process water in July; filling completed in October with cells 3 and 4 completely full, cell two approximately ¾ full, and cell one empty.

Chamokane Creek Bank Stabilization

- Streambank stabilization and restoration of the eroded south bank of Chamokane Creek to protect the adjacent wetland and pond.
- Work included: installing riprap, streambarbs, large woody structures, and plantings along the streambank.
- Construction started February 12 and was completed on February 20 by Knight Construction & Supply, Inc.
- Revegetation started on April 29, and was completed April 30.



Millsite Building Asbestos Inspection

- AES conducted building assessments, inspections, and material sampling for asbestos-containing materials from March 4th through March 8th; analysis and reporting in progress.
- Inspected buildings include: Administrative Office, Safety Trailer, Dry, Lab, Garage, Shop, Boiler Room, Mill Pump House, Spring Pump House, and Morgan former residence.

Fence Installation around Scour Pond in Lower North Area

- 1,500 feet of 6-foot high chain-link fence with barbless wire and two gates installed in May.
- Work was completed by Idaho Fence Co.

Lower North Area Gamma Exposure Rate Survey

- Work Plan Completed by Tetra Tech, May 15, 2013.
- Survey completed, reporting in progress.

Meadow Area Gamma Exposure Rate Survey

- Work Plan Completed by Tetra Tech, May 15.
- Survey completed, reporting in progress.

Ore Stockpile Area Soil Sampling For Further Characterization of the Uranium Source

- Work Plan Completed by Tetra Tech, May 15
- Excavated and sampled twenty-five test pits in the ore stockpile area. One sample collected per test pit location completed on June 26.
- Analyzed samples for Ra-226, Th-230, and U-nat.
- WME summary report submitted to DOH on October 14.

Ore Stockpile and Lower North Area Hydrogeologic, Geochemical, and Geotechnical Investigation

- Work Plan Completed by Hydro-Logic LLC, July 10.
- 5 wells installed in SA; 1 borehole drilled.
- 6 wells installed in LNA.
- 19 soil samples from soil drill cores sent for geotechnical testing & 10 soil samples from drill cores sent for geochemical (K_d) testing.
- Laboratory analysis and reporting in progress; anticipated submittal date of December 31, 2013.

Lower North Area Vegetation and Soil Sampling

- Work Plan completed by WME, LLC. September 10.
- Sampling completed in September with 12 vegetation samples and 16 soil samples submitted to the laboratory.
- Laboratory analysis and reporting in progress; anticipated submittal date of January 10, 2014.

WME, LLC
December 16, 2013

Evaporation Pond Embankment Material Sampling and Analysis

- Work Plan completed by WME, LLC. September 25, 2013.
- Sampling completed October 16, 2013 with 71 samples submitted to the laboratory.
- Laboratory data received the week of December 9, 2013; analysis and reporting in progress.

Midnite Mine Water Treatment Plant Sludge Disposal in TDA-4

- Water Treatment Plant operating from April through October 2013.
- 693 cy of sludge placed in TDA-4 from April through October 2013.
- Approximately 600 cy of ST2 cover material placed by MCE over the sludge.

Aerial Photography

- Aerial Photography completed on October 17, 2013 by 3Di GeoTerra Mapping Group
- Topographic Map produced with horizontal and vertical control provided by Benthin and Associates.

Demolition at Former Morgan Residence

- Asbestos building inspection completed by AES in March 2013.
- Demolition and disposal of buildings anticipated to be completed by MCE by the end of 2013.

Cover Form and Checklist for *Federal Register* (FR) Document Submissions to the Office of Policy (OP)

Section 1: Tracking information

Contact name: Office/Region: (choose one)

Contact phone and email:

Docket # *(if applicable)*: FRL # *(if applicable)*:

Name of document:

Name of File:

Other Information (alternate contacts, etc.):

Section 2: Requested Handling

You must select either Option 1 or Option 2.

☐ **Option 1: No Special Handling is Requested**. *Select this option if the special handling requests identified in Option 2 do not apply to your document. If you select this option, OP will submit your document to the OFR for publication without any special requests.*

☐ **Option 2: Special Handling is Requested.** *Select this option if one or more of the following apply to your document--and select all requests that apply.*

☐ **We need to SUBMIT to or PUBLISH in FR by a SPECIFIC DATE.** This document must be (choose one) Reason: (choose one)

Explain other:

This request is reserved to satisfy the requirements of court or meet the needs of senior policy officials. The FR team may ask for additional documentation. Before you request a modified schedule, please review our timetable at http://intranet.epa.gov/adplibrary/adp-milestones/fedreg.htm#schedule.

☐ **We need OFR to REVIEW and APPROVE the IBR contained in this rule**. The relevant IBR memo or letter and materials are attached.

☐ **We need to MANAGE the FR publication of multiple FR documents.** This document must (choose one) (choose one) the following FR document (choose one)

Title:

Docket # *(if applicable)*:

FRL *(if applicable)*: Published on *(if applicable):*

☐ **We need OFR to confirm their receipt of this FR document:** Select this option ONLY if you need to ask OFR to provide a confirmation of receipt in order to document EPA's compliance with a legal requirement to submit the document to OFR by a specific date.

More information about FR Publication can be found on our website: **http://intranet.epa.gov/adplibrary/adp-milestones/fedreg.htm**

Section 3: Checklist for Document Format and Package Components

The following section provides formatting requirements for materials included in a submission package. Requirements are based on OFR's Document Drafting Handbook. Failure to adhere to these requirements could delay the publication of your document.

☐ 1. EPA's Billing Code is present **(6560-50-P)** on original and each copy, on the first page of each document in the upper right corner.

☐ 2. The **title** is concise, does not contain overly specific information, and does not contain legal citations.

☐ 3. The **SUMMARY** section is no longer than one page.

☐ 4. The **SUMMARY** section does not contain legal citations *(i.e., CFR citations, FR citations, USC citations, etc.).*

☐ 5. The **DATES** section is labeled "**DATES**" *(Not "EFFECTIVE DATES", etc.).*

☐ 6. The **Table of Contents**, if included, matches the headings in the preamble.

7. **Signature Block – Original Paper Version***

- ☐ a. The signature block contains a legible date.
- ☐ b. The signer's name and title are typed or printed under the signature line.
- ☐ c. *(if applicable)* "Acting" is added, in front of the title, if a person other than the official holder of that title is acting in that capacity. *(Note: no "for" is permitted in the signature block)*
- ☐ d. Any changes are initialed and dated. (*For example, corrections to make the typed or printed name match the signature are made by striking through the incorrect name, and initialitng and dating the correction.)*
- ☐ e. No White-Out or corrective tape is used on the signature page.

8. **Signature Block – Word File***

- ☐ a. The signature page matches items 7a – c above.
- ☐ b. The date is spelled out, with a period at the end. *(Example: "February 6, 2014.")*

☐ 9. A rewritable CD **(CD-RW)** is included with the package. *(CD-R or DVD-RW are not acceptable)*

10. The CD-RW contains:

- ☐ a. the **(1) most recent Word version** of document that (2) **matches the original**,
- ☐ b. a scanned copy of the typesetting request form, and
- ☐ c. a scanned copy of the (signed) signature page.

☐ 11. The **original** document is **single-sided**, and each **copy** is **double-sided**.

☐ 12. The correct number of copies are included. This number will depend on the type of document you are submitting. See FR publishing website, under "Who do I submit my document to? How?"

Section 4: Certification and Signature

I certify that the CD-RW I am submitting as part of this package includes the **most recent Word file** of the document and matches the copies and the original included in this package.

Date/Signature of Contact Regarding Submitted Package

Re: Request for Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick:

REQUEST FOR EXTENSION OF TIME TO SUBMIT COMMENTS

Uranium Watch requests a 60-day extension of the time period to submit comments on the Environmental Protection Agency's (EPA's) Proposed Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings, 49 C.F.R. Part 61 Subpart W, Docket ID No. EPA–HQ– OAR–2008–0218. 79 Fed. Reg. 25388, May 2, 2014.

The request for a 60-day extension of time is based on the following.

Proposed Subpart W Factual Bases: One of the EPA's primary reasons for the proposed elimination of the requirement for radon monitoring and reporting at "existing" mill tailings impoundments (as defined in 40 C.F.R. § 61.251(d)) is the claim that the existing tailings impoundment at the Shootaring Canyon Mill (Garfield County, Utah) has a "synthetic liner." This claim is not supported by a citation in the proposed rule or

documentation in the Rulemaking Docket. The fact is that the tailings impoundment for the Shootaring Canyon Mill has a clay liner, not a synthetic liner.[1] This reality means that the EPA has a very shaky factual basis for its determination that, soon, any "existing" conventional tailings impoundments will all meet the standard in 10 C.F.R. § 61.252(b)(1), and, therefore, it is appropriate to eliminate any requirement for radon monitoring at "existing" tailings impoundments.

This incorrect factual claim regarding the Shootaring Canyon Mill and other misinformation, misleading information, incomplete information, and outdated information require a commenter to carefully review the proposed rule and supporting documents. Also, the EPA has asked for commenters' thoughts on various aspects of the proposed rule. These lengthy and detailed research and comment preparations require additional time in order to frame informed comments.

REQUEST FOR HEARING

I would also request a hearing on Subpart W rulemaking at White Mesa, San Juan County. I will be out of state from mid-June until the week of July 27, so request a hearing at White Mesa after July 27, 2014. Therefore, additional time for comments and hearings are necessary.

Thank you for consideration of this request.

Sincerely,

Sarah Fields

Subject: EPA Subpart W Rulemaking - Request for Extension of Time and Hearing

Dear Mr. Nesky,

Attached is letter I sent to Reid Rosnick requesting an extension of time for the public to submit comments and a request for hearing at White Mesa, near the only operating conventional uranium mill in the US.

Thank you,

Sarah Fields
Uranium Watch

Re: Request for Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick:

REQUEST FOR EXTENSION OF TIME TO SUBMIT COMMENTS

Uranium Watch requests a 60-day extension of the time period to submit comments on the Environmental Protection Agency's (EPA's) Proposed Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings, 49 C.F.R. Part 61 Subpart W, Docket ID No. EPA–HQ– OAR–2008–0218. 79 Fed. Reg. 25388, May 2, 2014.

The request for a 60-day extension of time is based on the following.

Proposed Subpart W Factual Bases: One of the EPA's primary reasons for the proposed elimination of the requirement for radon monitoring and reporting at "existing" mill tailings impoundments (as defined in 40 C.F.R. § 61.251(d)) is the claim that the existing tailings impoundment at the Shootaring Canyon Mill (Garfield County, Utah) has a "synthetic liner." This claim is not supported by a citation in the proposed rule or

documentation in the Rulemaking Docket. The fact is that the tailings impoundment for the Shootaring Canyon Mill has a clay liner, not a synthetic liner.[1] This reality means that the EPA has a very shaky factual basis for its determination that, soon, any "existing" conventional tailings impoundments will all meet the standard in 10 C.F.R. § 61.252(b)(1), and, therefore, it is appropriate to eliminate any requirement for radon monitoring at "existing" tailings impoundments.

This incorrect factual claim regarding the Shootaring Canyon Mill and other misinformation, misleading information, incomplete information, and outdated information require a commenter to carefully review the proposed rule and supporting documents. Also, the EPA has asked for commenters' thoughts on various aspects of the proposed rule. These lengthy and detailed research and comment preparations require additional time in order to frame informed comments.

REQUEST FOR HEARING

I would also request a hearing on Subpart W rulemaking at White Mesa, San Juan County. I will be out of state from mid-June until the week of July 27, so request a hearing at White Mesa after July 27, 2014. Therefore, additional time for comments and hearings are necessary.

Thank you for consideration of this request.

Sincerely,

Sarah Fields
sarah@uraniumwatch.org

Thank you for your reply Mr. Rosnick. I am glad to hear you can be on the call.

While we are in the process of developing the agenda for the NTAA/EPA Policy call on June 26th, I have attached last month's agenda that will give you an idea of how the call proceeds.

If you can, please send me a short paragraph describing your presentation, your name, title and any web links that would be helpful background information on your presentation.

Also, if you have a PowerPoint presentation, please send that to me and I will display it during our call and will flip the slides for you.

We should be getting other topics in the next few weeks, so feel free to send me this information any time next week.

Thanks and have a great weekend!

Andy

Andy,

I would be happy to make a presentation for the NTAA/EPA policy call on June 26 at 11 am PDT. I will plan on speaking for 10-12 minutes and allow the remaining time for questions. If you would kindly send me an agenda for the call I would appreciate it.

Please feel free to contact me if you have any questions. Thanks

Reid

Subject: Request for speaker

Hello Jed:

I was wondering if you could help secure a speaker for our upcoming NTAA/EPA Policy call regarding this issue linked below:

http://www.epa.gov/radiation/docs/neshaps/subpart-w/neshap_subpart-w_npr-final_-prepublication.pdf

http://tcots.epa.gov/oita/tconsultation.nsf/x/7C897AE2FCD62CF285257CB5004F585D?opendocument

I left a phone message with Mr. Rosnick and was hoping to address this issue on the upcoming call on June 26th at 11 am PT.

On our last call, this issue was raised by a concerned Tribal representative and I hope to have it addressed on our next call by having someone speak to this issue for 10-15 mintues and address any questions.

Please let me know if this might be possible.

Thanks,

Andy

I have communicated with Howard and Shaun regarding the government to government consultation that will take place on July 10th. While I still do not know the outcome of the conference call with HQ that occurred today on the same topic and since the consultation is about the NESHAP Subpart W and the associated/related enforcement, we think that the following folks should accompany Howard to the Ute Mountain Ute to conduct the consultation:

Alfreda Mitre, Angelique Diaz, and Cindy Reynolds (or her representative).

I'll work with Alfreda to see if we can set-up a conference call line for the rest of us, if appropriate.

Thanks!

Subject: RE: Government to Government Consultation on Subpart W: July 10, 2014: White Mesa

Yesterday's phone call with the Office of Radiation and Indoor Air (ORIA) and the Ute Mountain Ute tribe, requested by the tribe, was to discuss the approach for the July 10^{th} consultation. They have proposed 9am and are waiting for an official confirmation from us.

By the end of the week the tribe plans on submitting questions to ORIA and Region 8 that we will again discuss with the tribe by phone sometime the week of June 16^{th} or 23^{rd}. Their questions will further inform us of the specific content of the consultation a well as help us put together an agenda for that morning.

We asked them the general topics and it seems as though a lot of them relate to the Subpart W rulemaking, but as we know the Off-site Rule and Subpart W compliance at the White Mesa Mill are related to that subject. I'll let everyone know when we receive the specific questions from the Ute Mountain Ute, and will share what they are.

At the consultation, in addition to the Tribal Council, the Ute Mountain Ute plan to have in attendance the Environmental Director, a Water Quality Specialist, an Air Quality Specialist, and 2-3 attorneys. ORIA participants will be calling in and will include: Reid Rosnick (Subpart W Rulemaking workgroup chair), Mike Flynn (ORIA Director), and an OGC representative. Since they will be calling in, a line will be open and we can have additional Region 8 participants, if necessary.

Paul,

The Ute Mountain Ute Tribe has requested and the Region and HQ have agreed to a government to government consultation of the proposed NESHAP Subpart W rule, as it relates to the White Mesa Uranium Mill. The proposed rule is out for public comment and I believe that comment period ends July 27, 2014.

The consultation has been scheduled for July 10 and Howard (and other Region 8 personnel) will travel to the reservation and HQ will join via telephone.

I would recommend that an ORC Attorney be assigned and should accompany Howard to the consultation meeting.

I can fill-in the gaps once an Attorney is assigned. Please advise. Thanks.

Jasmine and Sara,

Are you aware of the consultation mentioned below? Art is recommending that an ORC attorney attend. Could you figure out the subject matter and let me know whether you'd recommend that one of you attend? For example, not sure if this will concern the CERCLA off site issues (that Jasmine is handling), or rather subpart W issues (air issues that Sara would presumably be handling), or perhaps the subset of the subpart W issues that reference the RCRA regs that Jasmine would handle, etc. Sounds like it may relate to the air rules, but I just don’t know. Also, do you know if any enforcement attorneys plan to attend? Trying to get handle on this.

Subject: Government to Government Consultation

Paul,

The Ute Mountain Ute Tribe has requested and the Region and HQ have agreed to a government to government consultation of the proposed NESHAP Subpart W rule, as it relates to the White Mesa Uranium Mill. The proposed rule is out for public comment and I believe that comment period ends July 27, 2014.

The consultation has been scheduled for July 10 and Howard (and other Region 8 personnel) will travel to the reservation and HQ will join via telephone.

I would recommend that an ORC Attorney be assigned and should accompany Howard to the consultation meeting.

I can fill-in the gaps once an Attorney is assigned. Please advise. Thanks.

Subject: RE: Government to Government Consultation

Hi Paul,

I heard that the Tribe requested the consulation but I hadn't heard about the timing of it. The consultation is in regard to CAA Subpart W, which is a CAA radon emission standard for operating uranium mill tailings. Specifically, the consultation is in regard to the proposed change to the current standard (the comment period closes on July 31).

Subpart W does not reference RCRA; it references NRC regulations. The CERCLA offsite rule references RCRA.

I may be able to attend depending on the time of the meeting (I have custody of my kids and need to get them off to summer camp that morning), but don't have to pick them up that evening.

Jasmine and Sara,

Are you aware of the consultation mentioned below? Art is recommending that an ORC attorney attend. Could you figure out the subject matter and let me know whether you'd recommend that one of you attend? For example, not sure if this will concern the CERCLA off site issues (that Jasmine is handling), or rather subpart W issues (air issues that Sara would presumably be handling), or perhaps the subset of the subpart W issues that reference the RCRA regs that Jasmine would handle, etc. Sounds like it may relate to the air rules, but I just don’t know. Also, do you know if any enforcement attorneys plan to attend? Trying to get handle on this.

Thanks Jasmine. From an earlier email, Sara is putting a call in with Art, to find out more background. So as you mention, it may be that RCRA issues really aren't a part of this, and that therefore you wouldn't need to take part. But let's see what Sara finds out.

Tony,

I made a few changes to the EventBrite website and would like you to review.

#1. I added this text "Speakers will be allotted 5 minutes to testify at the hearing. Speakers will be assigned a speaker number upon arriving, and will be called to give their testimony: Submission of written remarks is not required, but will be gladly accepted. All remarks and submissions become part of the official public record." In the following places: the main page, in the confirmation email/webpage and with the question (this was the best I could do with the formatting there are limitations to the number of characters on the question page and I had to put "dummy" checkboxes there to get all of the text included – I called EventBrite to verify this)

#2. I added "Please print and bring your ticket with you." in the confirmation email/webpage and on the main page.

#3. I moved what was in the confirmation email down to the confirmation webpage. The text in the email was formatted in HTML and that spot was for plain text only. I wasn't sure if you wanted both a confirmation email and webpage. (You can view the confirmation webpage by clicking the link in the note below the Customize order confirmation webpage section Note: HTML available. [View your current order confirmation page]

https://www.eventbrite.com/home/
Password: SRAPassword

Please take a look and let me know if there are any changes we can make or anything else that needs to be done for this registration site.

Thanks,
Rebecca

Subject: Request for speaker

Hello Jed:

I was wondering if you could help secure a speaker for our upcoming NTAA/EPA Policy call regarding this issue linked below:

http://www.epa.gov/radiation/docs/neshaps/subpart-w/neshap_subpart-w_npr-final_-prepublication.pdf

http://tcots.epa.gov/oita/tconsultation.nsf/x/7C897AE2FCD62CF285257CB5004F585D?opendocument

I left a phone message with Mr. Rosnick and was hoping to address this issue on the upcoming call on June 26th at 11 am PT.

On our last call, this issue was raised by a concerned Tribal representative and I hope to have it addressed on our next call by having someone speak to this issue for 10-15 mintues and address any questions.

Please let me know if this might be possible.

Thanks,

Andy

Subject: Uranium Mill Tailings Rule- Consultation with Ute Moutain - Notification Letter? Start of Consultation?

Toni-

I meet with R8 staff this afternoon regarding the tribal consultation that you entered yesterday. I understand that R8 is providing the on ground support for this consultation and will have staff from R8 also participate in the consultation along with HQ via teleconference.

I have made some changes based on my meeting today. The start date should be July 10 as this the date for the Ute Mountain consultation. The consultation was requested by the tribe so I added this information to the consultation record. Finally and most importantly the notification letter entered needs to be revised to reflect this specific consultation. R8 will craft and send it to Ute Mountain. A pdf copy will be entered in the notification field. Until that occurs, the notification field will remain blank. The May 8^{th} letter will be placed in the supplemental information field.

Since I also wear the EJ hat -- How are the communities being informed on their opportunity to participate? (I understand that the public meeting noted in the May 8^{th} letter is not occurring now). Are you or others in OAR working with your offices EJ coordinator?

Also what is happening with the other targeted tribes listed in the letter included in the supplemental field? Is or did OAR host a consultation with them?

I'm in tomorrow only in the morning. Also the OAR EJ coordinator is Marva King

Re: Request for 120-Day Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick and Nesky,

On behalf of Uranium Watch, Eastern Navajo Dine Against Uranium Mining, Laguna Acoma Coalition for a Safe Environment, Bluewater Valley Downstream Alliance, Nuclear Information and Resource Service, Earthworks, Western Colorado Congress, Nebraska Chapter of the Sierra Club, Grand Valley Peace and Justice, Western Nebraska Resource Council, Arizona Mining Reform Coalition, the Multicultural Alliance for a Safe Environment, and Tallahassee Area Community, Inc, we urge you to extend the public comment period deadline for an additional 120 days beyond the current deadline of July 31st, 2014 for the proposed rulemaking affecting 40 CFR Part 61, subpart W.

Given the complexity of this rule, and our desire to understand its implications to communities affected by radon emissions, we believe more time is needed to formulate meaningful comments to EPA and help maximize additional public participation, which should also include hearings in affected areas.

Thanks for your consideration. If you have concerns, questions, or comments, please direct them to the following email addresses.

Sincerely,

The undersigned

Subject: 40 CFR Part 61, Subpart W public comment deadline extension request

Dear Mr. Rosnick and Nesky,

Please find attached a letter signed by a dozen groups nationwide in support of EPA extending the public comment period for the proposed rulemaking affecting Subpart W, by 120 days.

I would appreciate your confirmation that you have received this letter.

Thank you very much,

--Pete Dronkers

Subject: Discussion of Questions Submitted by Ute Mountain Ute Prior to Consultation
Location: 866-299-3188, code 2023439563#

Start: Tue 6/24/2014 12:00 PM
End: Tue 6/24/2014 1:00 PM

Recurrence: (none)

Meeting Status: Accepted

Organizer: Rosnick, Reid
Required Attendees: Cherepy, Andrea; Childers, Pat; Colon, Toni; Angelique Diaz; Saldenha, Jasmine; Stahle, Susan; Schultheisz, Daniel; Peake, Tom; Patefield, Scott; Palomares, Art; Perrin, Alan; Harrison, Jed; Urdiales, Aaron; Scott, Jessica

NESHAPS Questions for UP...

Attached for your review is the set of questions received by the tribe leading up to consultation on July 10. We also hope to have a conference call with the tribe on June 26 to discuss the questions.

For this conference call, please review the questions and be prepared to discuss what expertise should be available for the call with the tribe. Thanks

Stahle, Susan

Hi Sue,

That's right--as a general matter tribal consultation is not exempt from public disclosure requirements.

Thanks,

Jessica Scott

I understood from Jessica Scott, our OGC attorney who counsels on tribal matters, that conversations between EPA and a tribe during a tribal consultation are not privileged - in other words, the information is subject to public disclosure.

Thus, I believe we should include the tribal consultation request letter and any supporting information submitted with it in the docket for the proposed rule. We should also post this information on the Subpart W website.

Jessica - please correct me if I am misstating anything.

Subject: Initial Questions from the UMUT

Dear Reid,

Attached are the initial questions from the UMUT to help the EPA and UMUT prepare for the July 10th consultation meeting. We hope that having a full discussion of these questions in the June 24-26 time period helps to make sure that we can have meaningful dialogue at the July 10th consultation meeting. Please plan accordingly when you put together your team and a time frame for the conference call (we anticipate here that it will take a few hours to get through the 28 questions).

I wanted to reiterate my offer to have a call between now and our June conference call with your EPA attorneys if there are concerns about the exchange of written materials or substantive discussion on any of the points contained in the initial questions list.

Best,

Celene Hawkins

Reid,
We are trying to get them finalized tomorrow (Friday) to send, but it may roll into Monday. Perhaps with that in mind we should scratch next Tuesday-Wednesday and aim for the 24-26th time frame. That will still give you a couple weeks before the consultation date to prepare.

Hi Scott,

We would like to have the conference call with you as soon as practicable. However, we would like to have your questions in hand so we can discuss them with you during the call. Can you give me a better idea of when you will be able to transmit your questions? I would like at least a day or two to get them to EPA participants so we can discuss your concerns more effectively. Thanks.

I'll be away from my desk all day, in training, but I will check my email and voice mail at the end of the day. Thanks again.

Subject: call next week Tuesday or Wednesday?

HI Reid,
We are working on preparing the questions that we will want answers for at the upcoming consultation meeting. We are planning to have those to your team at EPA in the next few days.
We would like to schedule our second pre-consultation call to clarify the questions. We have availability next Tuesday (I can skip out of a little of my ROC meeting if necessary) or Wednesday afternoon. I think we could bump it into the following week, 24-26th but I will need to confirm that with our team. Please consider some dates.
Thanks,
Scott

Stahle, Susan

From: Rosnick, Reid
Sent: Friday, June 13, 2014 6:12 AM
To: Stahle, Susan
Subject: FW: Subpart W Rulemaking Documents

FYI

From: sarah@uraniumwatch.org [mailto:sarah@uraniumwatch.org]
Sent: Thursday, June 12, 2014 1:25 PM
To: Rosnick, Reid
Cc: Group A-AND-R-DOCKET
Subject: Subpart W Rulemaking Documents

Dear Mr. Rosnick,

The following have become apparent:

1. The EPA did not receive a Clean Air Act (CAA) Section 114 response from Uranium One about the Shootaring Canyon Mill, and maybe did not even request such information. If the EPA had received such information, the EPA would not have made a false and misleading statement about the nature of the Shootaring Canyon tailings impoundment liner in the Subpart W Rulemaking May 2, 2014, *Federal Register* Notice (79 Fed. Reg. 25388).

2. The EPA never received a response from Denison Mines (USA) Corp. to the May 2009 CAA Section 114 letter requesting information about the evaporation ponds at the White Mesa Mill. This is apparent by the lack of information about the evaporation ponds at the White Mesa Mill in the “Risk Assessment Revision for 40 CFR Part 61 Subpart W – Radon Emissions from Operating Mill Tailings; Task 5 – Radon Emission from Evaporation Ponds,” by S. Cohen & Associates, November 9, 2010. The evaluation of Radon Emissions from Evaporation Ponds does not reference any Denison Mines communication and does not discuss the White Mesa Mill evaporation ponds. Clearly the EPA contractor did not have the pertinent information before them regarding the White Mesa Mill evaporation ponds.

3. The EPA must request, receive, and post the same information about the Shootaring Canyon Mill that was received for other uranium mills. The EPA must again request that the licensee, now Energy Fuels Resources Inc., provide information about the impoundments at the White Mesa Mill that store processing liquids. This would include Cells 1 and 4B, Robert’s Pond, and the fluids on top of Cells 3 and 4A. This would include data on the radium and other radiological contents of the fluids in these impoundments over time.

4. The EPA must extend the comment period to provide an opportunity for the EPA to obtain this relevant information, make it publicly available, and allow for public review.

5. The EPA should seriously consider withdrawing the May 2, 2014, *Federal Register* Notice, because the the proposed rule, as it applies to conventional uranium mill tailings impoundments, is based, in a significant part, on the incorrect and unsubstantiated claim that the Shootaring Canyon tailings impoundment has a synthetic liner. Therefore, the proposed rule lacks a significant factual basis.

Sincerely,

Sarah Fields

Stahle, Susan

From: Rosnick, Reid
Sent: Thursday, June 12, 2014 6:47 AM
To: Stahle, Susan
Subject: FW: Other Documents Missing from EPA Subpart W Rulemaking Website

---

From: sarah@uraniumwatch.org [mailto:sarah@uraniumwatch.org]
Sent: Wednesday, June 11, 2014 4:42 PM
To: Rosnick, Reid
Cc: Group A-AND-R-DOCKET
Subject: Other Documents Missing from EPA Subpart W Rulemaking Website

Dear Mr. Rosnick,

In addition to the missing Shootaring Canyon Clean Air Act (CAA) Section 114 documents, there are some White Mesa Mill documents that are missing from the list of Section 114 Letters/Responses on the EPA Subpart W Rulemaking website and the Rulemaking Docket at the federal rulemaking website.

1. The Denison Mines June 1, 2009, response to the February, 24, 2009, EPA CAA Section 114 request for White Mesa Mill information refers to attachments to their response. However, those attachments, which include the radon-flux test results since 1992 and a Reclamation Plan, were not posted to the Subpart W Rulemaking website.

2. The EPA sent Denison Mines a May 5, 2009, request for information regarding the radon emissions from the
White Mesa Mill evaporation pond(s). The response to that inquiry, if received, is not available to the public on the EPA Subpart W website. That response should be posted, or a note made that no response was
received. If no response was received, the EPA must ask again for that data.

3. Information regarding the emissions from the White Mesa Mill provided to the EPA in 2009 do not, of course, include the most recent Annual Subpart W Reports. The reports since 2008/2009 are relevant to the Subpart W rulemaking, particularly the reports starting with the 2012 Annual Subpart W Compliance Report. The 2012 Annual Report showed that radon flux for Cell 2 exceeded the Section 61.252(a) standard. The licensee commenced monthly reporting, as required by Section 61.254(b). The White Mesa Annual 2012 and 2013 reports and the monthly 2013-2014 reports are very relevant to the current rulemaking. These reports were submitted to the EPA Region 8, in addition to the Utah Division of Air Quality, so they are readily available to the EPA. White Mesa Mill Subpart W annual and monthly radon flux compliance reports since 2008 should be made part of the record of the Subpart W Rulemaking.

4. It is likely that attachments to other Section 114 responses have not been posted.

Please post the above referenced documents on the EPA Subpart W website and the Rulemaking Docket.

Thank you,

Sarah Fields
Program Director

Subject: Another Question re EPA Subpart W Rulemaking

Dear Reid,

Can you explain why the Subpart W Rulemaking Activity Webpage list of EPA requests for information from uranium recovery facilities and licensee responses (Section 114 Letters/Responses) does not include a request to Uranium One Inc. and Uranium One's response for the Shootaring Canyon Mill?

Did the EPA send a request for information? Did Uranium One respond?

Thank you,

Sarah Fields

Dear Reid,

The document, "Surface Water Hydrology Considerations in predicting radon releases from water-covered areas of uranium tailings ponds." does not appear to have been posted on the government rulemaking docket for
the Subpart W rulemaking. The PDF file is supposed to be there when linking to the following, but is not:

http://www.regulations.gov/#!documentDetail;D=EPA-HQ-OAR-2008-0218-0002

Thank you,

Attachments: Memo to Docket requesting hearing.docx; draft-website-text-on-hearing-plans.docx

Dear Sue:

Per our discussion yesterday, I have drafted a memo to the Docket to document INFORM Colorado's request for a public hearing for the Subpart W rulemaking. I have also drafted text to be put on the Subpart W website to inform the public that hearings have been requested, and that we are planning them. Please take a look at the attached files and provide your feedback. It would be nice to post the information to the website on Monday.

Subject: Amended Hearing Request and Request for Records

Dear Mr. Rosnick,

This is to amend my request for extension of time for the public to submit comments on the 40 CFR Part 16 Subpart W Rulemaking. I request a 120-day extension of time.

I have also realized that there are no Section 114 Letters/Responses for facility information for the Kennecott Sweetwater Mill. If the EPA is going to make assertions regarding the Sweetwater Mill, the documentation to support those assertions must be available to the public on the Rulemaking Docket and EPA Subpart W webpage.

Also, the EPA Background Information Document and the Risk Assessments refer to various other documents. However, there is scant information regarding public access to these records, and the EPA has not posted these documents to the EPA Subpart W Website.

A 120-day extension of time to submit comments will give the EPA time to request pertinent information from Uranium One, Energy Fuels, and Kennecott and make those responses and the documents referenced in the BID and Rick Assessments available to the public and for the public to review the documents in order to frame comments.

Thank you for your consideration of this request,

Sarah Fields

Re: Request for Extension of Comment Period and Request for Hearing: Docket ID No. EPA–HQ– OAR–2008–0218. Comments on Proposed Rule: Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings (40 C.F.R. Part 61 Subpart W). 79 Fed. Reg. 25388, May 2, 2014.

Dear Mr. Rosnick:

REQUEST FOR EXTENSION OF TIME TO SUBMIT COMMENTS

Uranium Watch requests a 60-day extension of the time period to submit comments on the Environmental Protection Agency's (EPA's) Proposed Revisions to National Emission Standards for Radon Emissions From Operating Mill Tailings, 49 C.F.R. Part 61 Subpart W, Docket ID No. EPA–HQ– OAR–2008–0218. 79 Fed. Reg. 25388, May 2, 2014.

The request for a 60-day extension of time is based on the following.

Proposed Subpart W Factual Bases: One of the EPA's primary reasons for the proposed elimination of the requirement for radon monitoring and reporting at "existing" mill tailings impoundments (as defined in 40 C.F.R. § 61.251(d)) is the claim that the existing tailings impoundment at the Shootaring Canyon Mill (Garfield County, Utah) has a "synthetic liner." This claim is not supported by a citation in the proposed rule or

documentation in the Rulemaking Docket. The fact is that the tailings impoundment for the Shootaring Canyon Mill has a clay liner, not a synthetic liner.[1] This reality means that the EPA has a very shaky factual basis for its determination that, soon, any "existing" conventional tailings impoundments will all meet the standard in 10 C.F.R. § 61.252(b)(1), and, therefore, it is appropriate to eliminate any requirement for radon monitoring at "existing" tailings impoundments.

This incorrect factual claim regarding the Shootaring Canyon Mill and other misinformation, misleading information, incomplete information, and outdated information require a commenter to carefully review the proposed rule and supporting documents. Also, the EPA has asked for commenters' thoughts on various aspects of the proposed rule. These lengthy and detailed research and comment preparations require additional time in order to frame informed comments.

REQUEST FOR HEARING

I would also request a hearing on Subpart W rulemaking at White Mesa, San Juan County. I will be out of state from mid-June until the week of July 27, so request a hearing at White Mesa after July 27, 2014. Therefore, additional time for comments and hearings are necessary.

Thank you for consideration of this request.

Sincerely,

Sarah Fields

Hi Sue,

FYI. Sarah is requesting a 60 day extension and a request that a hearing take place in White Mesa, UT. Considering that we are already extending the comment period, please advise on next steps . Thanks.

Sue - I think we should have someone cover the July 10 meeting. Please keep me in the loop once we get the questions from the tribe. Do we have any sense of when we will receive the questions? Lets plan to meet to discuss the questions once you and the program have had a chance to review them.

HI Sue,

I had a conference call with the tribe today to firm up the process for the July 10, 2014 consultation (notes attached). We will be having another call in a week or two to have further discussions. I would like to invite you to the next call and the consultation (invitations forthcoming) so that we make sure that we have legal coverage on both issues. Please feel free to call me tomorrow and we can discuss. Thanks

Reid

The EPA contact for this List is:

Dona M Harris
American Indian Environmental Office/Office of International and Tribal Affairs

Memo to: Docket EPA-HQ-OAR-2008-0218

Subject: 6-3-14 meeting with Ute Mountain Ute Tribe to discuss preparations for the July 10, 2014 consultation between EPA and the Tribe on EPA's current proposed regulation at 40 CFR 61

From: Reid J Rosnick, Radiation Protection Division

Members of EPA: Reid Rosnick, Andrea Cherepy, Pat Childers, Jed Harrison, Angelique Diaz, Scott Patefield, Scott Jackson, Randy Brown

Ute Mt. Ute Tribe representatives: Scott Clow, Celine Hawkins, Colin Larrick, Mike Keller, Tomoe Natori

Scott Clow noted that the consultation is scheduled for July 10, 2014 beginning at approximately 9 am, MDT. EPA noted that members of Region 8 will attend while members of ORIA will call in. The consultation will be entirely about the proposed Subpart W rulemaking. If any time remains, we could discuss the off-site or alternate fees issues.

Scott and Celine discussed the process leading up to the consultation: The Tribe will be sending EPA quite a few questions regarding the proposed rule. Examples include E.O. 13175, specific analyses of the White Mesa facility, development of the concept and definitions for non conventional impoundments and conventional impoundments. They would also like to discuss the references to the 40 CFR 192 proposal and how this fits in with Subpart W. There are many questions that will be sent to EPA in the next week. We will then schedule another conference call on either the week of June 16 or June 24 to discuss the questions so that we are prepared for the consultation.

The meeting was then adjourned.
