

**2024 Clean Heavy-Duty Vehicles Program
Disadvantaged Community County List**

Office of Transportation and Air Quality | March 2024

The US Environmental Protection Agency (EPA) is seeking to prioritize projects in the Clean Heavy-Duty Vehicles Program that are located in disadvantaged communities experiencing poor air quality. Applicants will be evaluated under Criterion 4.a and 4.b in Section V.A of the 2024 Clean Heavy-Duty Vehicles Program Notice of Funding Opportunity on the extent to which projects are located in these areas.

The counties listed below meet the disadvantaged community definition for the Clean Heavy-Duty Vehicles Program. An "X" indicates a specific indicator of poor air quality for each county.

For purposes of this competition and the evaluation of applications, "disadvantaged communities" are defined as meeting **both** of the following criteria:

1. Any county that includes at least one of the following:

- A. Any census tract that is identified as disadvantaged in the Climate and Economic Justice Screening Tool version 1.0 (<https://screeningtool.geoplatform.gov/en/#3/33.47/-97.5>);
- B. Any census block group that is at or above the 90th percentile for any of EJScreen's Supplemental Indexes when compared to the nation or state; and/or
- C. Any geographic area within Tribal lands as included in EJScreen (<https://www.epa.gov/ejscreen>).

AND

2. Any county that meets at least one of the following:

- A. Contains at least one designated nonattainment area or maintenance area for any of the following National Ambient Air Quality Standards. Data is sourced from EPA's Green Book of Nonattainment Areas for Criteria Pollutants as of January 2024 (www.epa.gov/green-book):
 - a. PM2.5 1997 Standard (Annual: 15 µg/m³, 24-hour: 65 µg/m³)
 - b. PM2.5 2006 Standard (Annual: 15 µg/m³, 24-hour: 35 µg/m³)
 - c. PM2.5 2012 Standard (Annual: 12 µg/m³, 24-hour: 35 µg/m³)
 - d. Ozone (O3) 2008 Standard (8-hour: 0.075ppm)
 - e. Ozone (O3) 2015 Standard (8-hour: 0.070ppm); and/or
- B. Contains at least one census tract where the modeled ambient diesel PM concentration from the 2019 Air Toxics Screening Assessment is above the 80th percentile (0.38 µg/m³ for 2019) for census tracts nationwide. The 80th percentile is a programmatic cutoff designed to help evaluate those areas that are most likely to have higher concentrations of diesel PM in the year of analysis (i.e., the year for which data are available); this level was not chosen based on risk or other health-based criteria or thresholds. AirToxScreen is a screening tool and there are limitations and uncertainties associated with it; see: <https://www.epa.gov/AirToxScreen/airtoxscreen-limitations>.
